It is of a brownish black colour, is hard and tough, cuts easily, and takes a good polish on which account it is largely used for making ink combs, brooches, bracelets, and many other ornaments. It is not affected by water or any of the other caoutchouc solvents. As it is especially distinguished by the large quantity of electricity which it evolves when rubbed, it is much used in the construction of electric machines. Called also *Albionite*. — 2 A name sometimes given to vulcanic garnet or pyroxene, from its being found in ejected blocks and lava.

**Vulcanization** (vul'kan-iz-ā-shon) *a.* A method of treating caoutchouc or India-rubber with some form of sulphur to effect certain changes in its properties, and yield a soft (vulcanized India-rubber) or a hard (vulcanite) product. This was originally effected by dipping the rubber in molten sulphur and heating it to nearly 300°. Several other methods have been employed, probably the best of which for general purposes consists in mechanically mixing the rubber at a moderate heat with fumes of sulphur, and subsequently 'curing' it in superheated steam at from 260° to 300° Fahr. Other ingredients, as litharge, white lead, zinc-white, whiting, &c., are added to the sulphur to give colour, softness, &c., to the rubber. The substance thus formed possesses the following properties: it remains elastic at all temperatures; it cannot be dissolved by the ordinary solvents, neither is it affected by heat with a considerable range of temperature; finally it acquires extraordinary powers of resisting compression, with a great increase of strength and elasticity. Vulcanized India-rubber is employed with great success for very many useful purposes, for waterproofing cloth for boots, shoes, hats, toys, building buffers, wheel tires, washers, valves, pipes, fire-hoses, medical and surgical appliances, &c. Hard vulcanized rubber is known as ebonite or vulcanite. *See VULCANITE.*

## W.

**W** is the twenty-third letter of the English alphabet. It takes its form and its name from the union of two V's, the character V having formerly the name and force of U. (See **V** and **U**.) The name, double u, however, being given in the letter from its form or composition, and not from its sound, is not a very suitable one. In the Anglo-Saxon alphabet it had a character with a distinctive form of its own, the more modern letter being adopted in the thirteenth century. This letter is used to represent two sounds, the one which distinctively belongs to it being that which it has at the beginning of a syllable and followed by a vowel, as in *was, well, dwell, away, forward, &c.* This sound has somewhat the character of a vowel, and w in such a position is hence often spoken of as a semi vowel. It is formed by opening the mouth with a close circular configuration of the lips, the organs having exactly the position they have in pronouncing the *so* of *soot*. Yet it has not really a vowel sound in such cases, and *well*, for instance, is not equivalent to *so-well*. This fact is more conclusively shown by such words as *wood, woman*, in which the *so*-sound is distinctly preceded by a consonant. Its true character is also shown by the definitions given by the best modern phonologists for a consonant and a vowel. Thus, Mr. Melville Bell defines a vowel as the result of an open position of the oral organs, an articulation (or consonant) as the result of an opening action of the organs. It is this opening action that marks *w* as distinct from *so*, yet pronounced in a drawing manner. It is hardly different in force. At the end of syllables in which position it is always preceded by a vowel, it has either no force at all (or at most lengthens the vowel), as in *law, lawful, to go, low, hollow, &c.*, or it forms the second element in a diphthong, as in *now, cow, new, few*, being then really a vowel, and equivalent to the *u* in *neutral, though, &c.* Followed by *r* it is initial in a considerable number of English words, as *wrap, write, wrong, &c.* It is now silent in such positions, though it was long sounded, as it still is in Scotland. **W** is another initial combination, as in *whet, where, whale, whet, &c.* In Anglo-Saxon these words were spelt with *wh* (which in cognate words represents *hw*, *L. h* initial), there being a guttural sound originally heard before the *w*. In Scotland, in such words as *what, whole*, a very decided guttural is heard before *w*. With the best speakers of modern English, however, *wh* seems to be *w* with a slight aspiration after it, though there is a tendency to pronounce *wh* pure and simple. In Anglo-Saxon *wh* was also an initial sound, thus *lief* was originally *whief*, the *w* having

disappeared. It has also disappeared from *tree, three, four, corn, wash, sister, &c.*, and, as above mentioned, it is not heard in many words, to which may be added such as *sword, two, answer, purpose, &c.* In many words it has taken the place of an older *g* as in *law, mass, &c.* (See **G**.) It has intruded itself into *whole, where, &c.* coming before a *wh* often has the effect of giving the latter an *s*-sound (comp. *swell, well, water, &c.*); *qu* (*-tr*) has the same effect. — An abbreviation **W** stands for west, **WNW** for west-north-west, **WSW** for west-south-west, &c.

**Wagon**, **Waggon** (wag'on), *n.* [A Sax. *wagon*, *waggon*, whence which in later times became *wagon*, *D* and *G* *wagen*, *loot* and *30* *wage*, *Dan* *wagen*, *lit.* a carriage, what carries, from root seen in *A* *Wage*, *loot* *wage* to carry, *cg* *Wage* *loot*, *I* *Wage*, to carry (whence *wage*).] *Wagon* also to *wag*, *wag*, *wag*, *etc.* *Shak.* remarks that *wagon* cannot come directly from the *A* *Wage* *loot* being the word that has directly descended from it (with some change of form as in *Wage*, *loot*, *etc.*). He therefore regards *wagon* as borrowed from the Dutch in the fifteenth or sixteenth century. Yet it seems strange that with *wagon* in common usage we should have borrowed another word of the same signification. 1. A four-wheeled vehicle for the transport of heavy loads. The English wagon is usually a strong heavy machine drawn by two horses yoked abreast. The fore wheels are much smaller than the hind pair, and their axle is swivelled to the body of the wagon to facilitate turning. The bodies of most wagons are not on springs on account of the weight of the vehicle and the stress of the standing power of the horse, who expends his force in pulling only the weight being distributed over the four wheels. Common varieties of the wagon are the brewer's dray, the railway trolley and the agricultural wain. *Wagons*, such as are used by carriers, are frequently provided with wooden boxes, over which a covering of heavy canvas or the like may be stretched to protect their contents from rain. The ends of the boxes are inserted in staples on each side of the vehicle, so that tilt and bows can be readily removed when not required. In the United States wagons of a much lighter build, and drawn by one horse only are much used for the conveyance of passengers and light commodities. - 2. An open four-wheeled vehicle for the conveyance of goods on railways. 3. A chariot. 'Her wagon spokes made of long spinners' legs. *Shak.*

Tents were erected in the churchyard to supply refreshments to the crowd on the morrow, which was kept as a holiday. Through the large attendance from neighbouring parishes at *wakes*, devotion and reverence gradually diminished, until they ultimately became mere fairs or markets, characterized by merry-making and often disgraced by indulgence and riot; hence, a merry-making; a festive gathering. The legs are short and loosely articulated, the five toes on each foot are connected by webs. The upper canine teeth are enormously developed in the adults, constituting two large pointed tusks directed downwards and slightly outwards, projecting considerably below the chin, and measuring usually 12 to 15 inches in length, sometimes even 2 feet and more. There are no external ears. The animal exceeds the largest ox in size, attaining a length of 20 feet. The walrus is gregarious but shy, and very fierce when attacked. It inhabits the shores of Spitzbergen, Hudson's Bay, and other places in high northern latitudes, where it is hunted by whalers for its blubber, which yields excellent oil; for its skin, which is made into a valuable thick and durable leather; and for its tusks, the ivory of which, though coarse grained, is compact, and is employed in the arts.

Both legends agree in the sentence pronounced by Christ on the offender, "Thou shalt wander on the earth till I return." trouble; akin to Mod. G. *werren*, to embroll, confuse; D. *war*, entanglement, confusion, *warren*, to disturb, to embroll. Supposed to be connected with *worre*, through the sense of entanglement or confusion.] 1. A contest between nations or states (*international war*), or between parties in the same state (*civil war*), carried on by force of arms, usually arising, in the first case, from disputes about territorial possessions and frontiers, unjust dealings with the subjects of one state by another, questions of race and sentiment, jealousy of military prestige, or mere lust of conquest, rarely nowadays from the whim of a despot; in the second case, from the claims of rival contenders for supreme power in the state, or for the establishment of some important point connected with civil or religious liberty. In all cases the aim of each contending party is to overthrow or weaken the enemy by the defeat or dispersion of his army or navy, the occupation of important parts of his country, such as the capital or principal administrative and commercial centres, or the ruin of his commerce, thus cutting off his sources of recuperation in men, money, and material. International or public war is always understood to be authorized by the monarch or sovereign power of the nations; when it is carried into the territories of a hitherto friendly power it is called an *aggressive* or *offensive* war, and when carried on to resist such aggression it is called *defensive*. Previous to the outbreak of hostilities between states, the power taking the initiatory step issues a *declaration of war*, which now usually takes the form of an explanatory manifesto addressed to neutral governments. During the progress of the struggle certain laws, *usages*, or *rights of war* have come to be generally recognised; such laws permitting the destruction or capture of armed enemies, the destruction of property likely to be serviceable to them, the stoppage of all their channels of traffic, and the appropriation of everything in an enemy's country necessary for the support and subsistence of the invading army. On the other hand, though an enemy may be starved into surrender, wounding, except in battle, mutilation, and all cruel and wanton devastation, are contrary to the usages of war, as are also bombarding an unprotected town, the use of poison in any way, and torture to extort information from an enemy; and generally the tendency in all laws and usages of war is becoming gradually more favourable to the cause of humanity at large. — 2. 5. The period of time during which one person or body of persons watch or stand sentinel, or the time from one relief of sentinels to another; hence, a division of the night, when the precautionary setting of a watch is most generally necessary. The Jews, like the Greeks and Romans, divided the night into military watches instead of hours, each watch representing the period for which each separate body of sentinels remained on duty. The proper Jewish reckoning recognized only three such watches: the first (lasting from sunset till about 10 P. M.), the second or 'middle watch' (10 P. M. to 2 A. M.), and the third, or 'morning watch' (from 2 A. M. till sunrise). After the establishment of the Roman power they were increased to four, which were named according to their numerical order, as first, second, &c., or by the terms *even*, *midnight*, *cock-crowing*, and *morning*, these terminating respectively at 9 P. M., midnight, 3 A. M., and 6 A. M. See *Ex. xiv. 24*; *Judg. vii. 19*; *Lam. ii. 19*; and *Mark xiv. 25*; *Mark xiii. 35*.

6. *Naut.* (a) The period of time occupied by each part of a ship's crew alternately while on duty. The period of time called a *watch* is four hours, the reckoning beginning at noon or midnight. Between 4 and 8 P. M., the time is divided into two short or *dog-watches* in order to prevent the constant recurrence of the same portion of the crew keeping the watch during the same hours. Thus, the period from 12 to 4 P. M. is called the *afternoon watch*, from 4 to 6 the first *dog-watch*, from 6 to 8 the second *dog-watch*, from 8 to 12 the *first night watch*, from 12 to 4 A. M. the *middle watch*, from 4 to 8 the *morning watch*, and from 8 to 12 noon the *forenoon watch*. When this alternation of watches is kept up during the 24 hours, it is termed having *watch and watch*, in distinction from keeping all hands at work during one or more watches. *Anchor watch*, a small watch composed of one or two men appointed to look after the ship while at

anchor or in port. (b) A certain part of the officers and crew of a vessel who together attend to working her for an allotted time. The crew of every vessel while at sea is generally divided into two portions: the *star-board watch*, which in the merchant service is the captain's watch, and is often commanded by the second mate; and the *port watch*, which in the merchant service is commanded by the chief mate. In the royal navy these watches are commanded by the lieutenants successively.—7. Anything by which the progress of time is perceived and measured; as, (a) a candle marked out into sections, each of which was a certain time in burning.

Fetch me a bowl of wine. Give me a *watch*. *Shak.*

(b) A small time-piece, now universally circular in shape, to be carried in the pocket or about the person. The essential parts of a watch are the dial on which the hours, minutes, and seconds are marked, the hands which move round the dial pointing to these divisions, the train of wheels which carry round the hands, &c., the balance which regulates the motion of the wheels, and the coiled spring (the mainspring), whose elastic force produces the motion of the whole machinery, the movement being inclosed in a protecting case usually of gold or silver.—A *repeating watch* or *repeater* has in addition a small bell, gong, or other sounding object on which the hours, half-hours, quarters, &c., are struck on the compression of a spring. A *chronometer watch* or *pocket chronometer* is one of the finest kinds of watches fitted with a compensation balance and other devices which prevent the variations of temperature from affecting the regular movement of the watch. (See **CHRONOMETER**.) Watches were invented at Nürnberg about the beginning of the sixteenth century, and for a long time the wearing of a watch was considered in some degree a mark or proof of gentility. Thus Malvolio remarks in anticipation of his great fortune.

I frown the while; and perchance wind up my *watch*, or play with my—some rich jewel. *Shak.*

8. In *pottery*, a trial piece of clay so placed in a kiln that it can be readily withdrawn to enable the workmen to judge by its appearance of the heat of the fire, and the condition of the ware remaining in the saggars.—The *Black Watch*, a name originally given to certain armed companies, whose uniform partly consisted of a dark tarten, and who were employed by government as an organized force about 1780 to watch the turbulent Highlands of Scotland. In 1739 these companies were embodied into a regular regiment, the 42d infantry regiment of the British army, which still retains the historic appellation of the *Black Watch*.—*Watch and ward*, the ancient custom of watching by night and by day in towns and cities. English writers up to the seventeenth century recognize a distinction between *watch* and *ward*, the former being used to signify a watching and guarding by night, and the latter a watching, guarding, and protecting by day. Hence, when the terms were used in combination, especially in the phrase to *keep watch and ward*, they implied a continuous and uninterrupted watching and guarding, constant vigilance and protection by night and by day.

**Water** (wā'tēr), *n.* [O. E. *waters*, *weter*, *wæter*, A. Sax. *water*; O. Sax. *water*, D. and L. G. *water*, G. *wasser*. The Scandinavian forms are somewhat different: Dan. *vand* (for *vædn*), Icel. *vætn*, Sw. *vatten*; similarly Goth. *vato* (pl. *vaterna*). From a root *vad*, *ud*, seen also in L. *udus*, wet, *unda*, a wave; Gr. *hydōr*, Skr. *udān*, water. Akin *vet*. *Otter* is also from this root, lit. the water animal.] 1. A fluid, the most abundant and most necessary for living beings of any in nature, except air. Water, when pure, is transparent, inodorous, tasteless; a powerful refractor of light, an imperfect conductor of heat and electricity; it is very slightly compressible, its absolute diminution for a pressure of one atmosphere being only about 51.3 millionths of its bulk. Although water is colourless in small quantities, it is blue like the atmosphere when viewed in mass. It assumes the solid form,

that of ice or snow, at 32° F., and all lower temperatures; and it takes the form of vapour or steam at 212° F. under a pressure of 30.9 ins. of mercury, and retains that form at all higher temperatures. Under ordinary conditions water possesses the liquid form only at temperatures lying between 32° and 212°. It is, however, possible to cool water very considerably below 32° F. and yet maintain it in the liquid form; the vessel containing the water must be perfectly clean, and the water must be maintained in a state of perfect rest. Water may also be heated, under pressure, many degrees above 212° F. without passing into the state of steam. The specific gravity of water is 1 at 39° 2' F., being the unit to which the specific gravities of all solids and liquids are referred, as a convenient standard, on account of the facility with which it is obtained in a pure state; one cubic inch of water at 68° F., and 29.9 inches, barometrical pressure, weighs 252.458 grains. Distilled water is 815 times heavier than atmospheric air. Water is at its greatest density at 39° 2' F. (= 4° C.), and in this respect it presents a singular exception to the general law of expansion by heat. If water at 39° 2' F. be cooled, it expands as it cools till reduced to 32° when it solidifies; and if water at 39° 2' F. be heated, it expands as the temperature increases in accordance with the general law. In a chemical point of view water exhibits in itself neither acid nor basic properties; but it combines with both acids and bases forming *hydrates*; it also combines with neutral salts. Water also enters, as a liquid, into a peculiar kind of combination with the greater number of all known substances. Of all liquids water is the most powerful and general solvent, and on this important property its use depends. Without water not only the operations of the chemist but the processes of animal and vegetable life would come to a stand. In consequence of the great solvent power of water it is never found pure in nature. Even in rain-water, which is the purest, there are always traces of carbonic acid, ammonia, and sea-salt. Where the rain-water has filtered through rocks and soils, and reappears as spring or river water, it is always more or less charged with salts derived from the earth, such as sea-salt, gypsum, and chalk. When the proportion of these is small the water is called *soft*, when larger it is called *hard water*. The former dissolves soap better, and is therefore preferred for washing; the latter is often pleasant to drink. The only way to obtain perfectly pure water is to distil it. Distilled water is preserved in clean well stopped bottles, and used in chemical operations. Water is reposit in the earth in inexhaustible quantities, where it is preserved fresh and cool, and from which it issues in springs, which form streams and rivers. But the great reservoirs of water on the globe are the ocean, seas, and lakes, which cover more than three-fifths of its surface, and from which it is raised by evaporation, and, uniting with the air in the state of vapour, is wafted over the earth ready to be precipitated in the form of rain, snow, or hail. Water is a compound substance, consisting of hydrogen and oxygen, in the proportion of 2 volumes of the former gas to 1 volume of the latter; or by weight it is composed of 2 parts of hydrogen united with 16 parts of oxygen. Its formula is H<sub>2</sub>O. — 2. Water collected in a body; the ocean; a sea; a lake; a river; any collection of water. 'Such as travel by land or by water.' Common Prayer.

(b) Urine; the animal liquor secreted by the kidneys and discharged from the bladder. Shak. 5. The colour or lustre of a diamond or pearl, sometimes perhaps of other precious stones; as, a diamond of the first *water*, that is, perfectly pure and transparent. Hence the figurative phrase, a man or a genius of the first *water*, that is, of the first excellence. 'Diamonds of a most praised *water*.' Shak. — *Water bewitched*, a term applied to any

The whole column, which after the function ceases from the sea to the clouds, assumes a magnificent appearance, being of a light colour near its axis, but dark along the sides.

**Wave** (wâv), *n.* [O.E. *weave*, from *A. Sax. wecy*, a wave, a word perhaps allied to the verb to *wag*; Icel. *vaðgr*, *G. wage*, *D. vove*, a wave; the form of the word in English has been modified by the verb to *weave*, so that *weave* the noun may be regarded as a kind of hybrid word. See *WAVE*, *v.t.*] 1. An undulation, swell, or ridge on the surface of water or other liquid resulting from the oscillatory motion of its component particles, when disturbed from their position of rest by any force; especially, the rolling swell produced on the surface of the sea or other large body of water by the action of the wind; a billow; a surge. When the surface of a liquid is pressed down at any part, the adjoining parts rise, but sink again by the action of gravity; and acquiring a momentum proportionate to the mass and height, descend below the original level, displacing other parts near them, which rise and sink in a similar manner. The result is a reciprocating motion, the particles to which the primitive impulse was communicated being alternately the lowest and the highest, forming the series of ridges and hollows called *waves*. Where the depth of the liquid is invariable over its extent, or sufficient to allow the oscillations to proceed unimpeded, no progressive motion takes place, each ridge or column being kept in its place by the pressure of the adjacent columns. Should, however, free oscillation be prevented, as by the shelving of the shore, the columns in the deep water are not balanced by those in the shallower parts, and they thus acquire a progressive motion towards the latter, or take the form of *breakers*, hence the waves always roll in a direction towards the shore, no matter from what point the wind may blow. When waves are produced by the disturbance of a small quantity of the liquid, as when a pebble is thrown into a pool, they appear to advance from the disturbed point in widening concentric circles, the height of the wave decreasing gradually as it recedes from the centre; but there is no progressive motion of the liquid itself, as is shown by any body floating on its surface. The whole seems to roll onwards, but, in reality, each particle of water only oscillates with a vertical ascent and descent. The height of the wave depends in a great measure on the depth of the water in which it is produced. The waves of the ocean have been known in some instances to have reached a height of 43 feet, measured from the trough to the crest. The horizontal pressure of a strong Atlantic wave, as tested by Stephenson's marine dynamometer, has been recorded as high as 3 tons to the square foot. It is a matter of common observation that a wave of much greater dimension than others occurs at certain intervals, rolling much higher on the shore than those im-

mediately preceding or following it, or breaking with immense force over the decks of vessels on the open sea. This is caused when several coexisting series of waves moving with different velocities meet, and the crests of two or three of them become superimposed upon each other. Several series of waves moving in different directions may also coexist without destroying each other, giving rise to the chopping seas or cross swells so troublesome to mariners. The length of a wave is equal to the space between the most elevated points of two adjoining waves, or between the lowest points of two adjoining hollows. A wave is said to have passed through its length when its elevated part has arrived at the place where the elevated part of the next wave stood before; or, the situation of two contiguous waves being given, when one of these has arrived at the place of the other; and the time which is employed in this transition is called the time of a wave's motion or the time of an undulation. The velocity of a wave is the rate at which the points of greatest elevation or depression seem to change their places. — *Tidal wave*. See *TIDE-WAVE*. — 2. In *physics*, a vibration propagated from one set of particles of an elastic medium to the adjoining set, and so on; sometimes, but not always, accompanied with a small permanent displacement of such particles. The theory of the motion of waves is of great importance in physical science; since, not only is it connected with the phenomena of the waves of the ocean ordinarily produced by the wind, the tidal wave, &c., it has also a close relation to the phenomena of undulating musical strings, the undulations in solids, as in earthquake waves, &c., while we know that sounds in air are propagated as waves, and that even light is now generally held to be a form of wave-motion. See *SOUND*, *LIGHT*, *UNDULATORY*. — 3. *Water*. [Poetical.]

I'll furnish thee with *wave*, bread and wine.

white, brittle, and translucent in thin seg-  
ments. It has neither taste nor smell; it has  
a specific gravity of from 0.950 to 0.960. It  
melts at 156° and softens at 86°, becoming  
so plastic that it may be moulded by the  
hand into any form. It is a mixture of three  
substances, called respectively myricin, cerotic  
acid, and cerolin, in very variable pro-  
portions. These substances are themselves  
composed of carbon, hydrogen, and oxygen.  
Wax is extensively employed both in its  
original and bleached state, in the latter  
state it is used for candles, and in numerous  
ceramics, ointments, and plasters. It is also  
used in forming figures of images, busts, &c.,  
in the preparation of anatomical models, in  
the preparation of artificial fruit, flowers,

and Japan wax. It may be obtained from  
the pollen of many flowers, and it forms a  
part of the green fecula of many plants,  
particularly of the cabbage. It appears as  
a varnish upon the fruit and the upper  
surface of the leaves of many trees, as in  
the wax-palm and wax-myrtle. Called also

by bees serves for the nourishment of their  
larvæ. (e) A substance used in sealing let-  
ters. See **SEALING-WAX**. (f) A thick resinous  
substance used by shoemakers for rubbing

G. *wecce*, *wedge*, possibly from the same root as *wag*, *way*, *weigh*, and signifying lit. the mover.] 1. A piece of wood or metal, thick at one end and sloping to a thin edge at the other, used in splitting wood, rocks, &c. The wedge is a body contained under two triangular and three rectangular surfaces, as in the figure, where the triangles ABE, DCF are the ends, the rectangles ADEF, BCFG the sides, and the rectangle ABCD the top. The wedge is one of the mechanical powers, and is used for splitting blocks of timber and stone; for producing great pressure, as in the oil-press; and for raising immense weights, as when a ship is raised by wedges driven under the keel, &c. If the power applied to the top were of the nature of a continued pressure, the wedge might be regarded as a double inclined plane, and the power would be to the resistance to be overcome, as the breadth of the back, DC, to the length of the side, DE, on the supposition that the resistance acts perpendicularly to the side. But since the power is usually that of percussion with a hammer, every stroke of which causes a tremor in the wedge, which throws off for the instant the resistance on its sides, no certain theory can be laid down regarding it. To calculate the power, we require the additional elements of weight of the hammer, momentum of the blow, and the intervals between the blows, and further, the amount of tremor in the wedge and its antagonism to the resistance on the sides. All that is known with certainty respecting the theory of the wedge is that its mechanical power is increased by diminishing the angle of penetration DFC. All cutting and penetrating instruments, as knives, swords, chisels, razors, axes, nails, pins, needles, &c., may be considered as wedges. The angle of the wedge in these cases is more or less acute, according to the purposes to which it is to be applied. — 2. A mass of metal, especially if resembling a wedge in form. 'A *wedge* of gold of fifty shekels weight.' *Josh. vii. 21*. 'Wedges of gold, great anchors, heaps of pearls.' *Shak*. — 3. Something in the form of a wedge.

See how in warlike muster they appear, In rhombs, and *wedges*, and half-moons, and wings. *Milton*.

— The thin or small end of the wedge, is used figuratively of an initiatory move of small apparent importance, but which is calculated to produce or lead to an ultimate important effect.

In determining weight in cases where very great precision is desired, due account must be taken of temperature, elevation, and latitude. The apparent weight of any substance is less than its true weight by the weight of as much air as is displaced by it; therefore, as the density of the air is variable—air when warmed expanding very much more than any solid—a piece of metal appears to weigh more in warm than in cold weather. might have been given to *wheat*. It might have been called eared, nutritious, graceful, waving, the incense of the earth.' (In Sanskrit it was called the incense of the earth, *go-dhama*.) 'But it was simply called the *white*, the white colour of its grain seeming to distinguish it best from those plants with which otherwise it had the greatest similarity. For this is one of the secrets of onomatopoeia—that it should express, not the most important or specific quality, but that which strikes our fancy.' *Max Müller.*]

A plant of the genus *Triticum*, and the seed of the plant, which furnishes a white flour for bread and is by far the most important species of grain cultivated in Europe. It grows readily in almost every climate; but its natural home seems to be a temperate climate, and the soils best adapted for its culture are rich clays and heavy loams. Of cultivated wheats there are many varieties, the differences, however, being mostly due to soil, climate, and mode of cultivation. Three primary varieties may be mentioned: (a) *T. hybernium* (*muticum*), winter or un-bearded wheat; (b) *T. æstivum* (*aristatum*), summer or bearded wheat; (c) *T. Spelta* (*ad-hærens*), spelt or German wheat, which is of much less value than the others, but grows on poorer soils and more elevated localities. White wheat and red wheat are names applied according to the colour of the grain, the red sorts being generally harder than the white, but of inferior quality, and the yield is less. Winter wheat is sown in the autumn, with the view of being harvested the following year; summer wheat is sown in the spring of the year in which it is reaped. The best English wheat yields from 75 to 85 per cent of fine flour, the inferior kinds only from 64 to 68 per cent. See *TRITICUM*.

**Wheat-ear** (whét'ër), *n.* An ear of wheat. **Wheat-eat** (whét'ër), *n.* [It is difficult to see what connection this name can have with *wheat*. More probably it is from A. Sax. *hwæt*, sharp, keen (see *WHET*), a supposed keenness of hearing being suggested by the decided way in which the position of the ear is marked by black feathers.] A small bird of the genus *Saxicola* (*S. ænanthe*), and family *Sylviæ*, belonging to the dentirostral section of the order *Insectores*. It is also known by the names of *Fallow-hatch*, *White-tail*, &c. See *FALLOW-FINCH*.

to fifteen, among the chaffy flowers of the wheat, where they are hatched in about eight or ten days, producing little footless maggots, whose ravages destroy the flowers of the plant, and render it shrivelled and worthless. Wheels, as applied to carriages, usually consist of a nave, into which are inserted spokes or radii, which connect it with the periphery or circular ring. Wheels are most important agents in machinery, being employed in a variety of forms and combinations, for the purpose of transmitting motion, regulating velocity, converting one species of motion into another, reducing friction, and equalizing the effect of forces applied in an intermittent or irregular manner. They receive different names according to their forms and uses; as, *balance-wheel*, *cog-wheel*, *crown-wheel*, *dash-wheel*, *eccentric*, *fly-wheel*, *friction-wheel*, *lantern-wheel*, *paddle-wheel*, *pinion*, *pin-wheel*, *plan-et-wheel*, *ratchet-wheel*, *scoop-wheel*, *spur-wheel*, *tread-wheel*, *turbine*, &c., which are described at more or less length according to their importance under these headings:—

2. Any instrument, apparatus, machine, or other object having a wheel like shape, or the essential feature of which is a wheel; as, (a) a machine for spinning yarn or thread. See *SPINNING-WHEEL*.

I see the sailor at the *wheel*. *Tennyson.*

(d) An instrument of torture generally used for criminals of the most atrocious class, formerly employed in France and Germany. In some places it consisted of a carriage-wheel on which the criminal was placed with his face upwards, and his legs and arms extended along the spokes. On the wheel being moved round the executioner broke the wretch's limbs by successive blows with a hammer or iron bar, and after a more or less protracted interval put an end to the sufferings of his victim by two or three severe blows, called *coups de grâces* (mercy strokes), on the chest or stomach, or by strangling him. In Germany its use lingered down till the beginning of the present century.

The lifted axe, the agonizing *wheel*,  
Luke's iron crown, and Damien's bed of steel.

4. The burthen of a song: a doubtful explanation by Giovanni.  
You went song down a-down, as you sail him a-down.  
O, how the wheel becomes a. Shaw.

—Wheel and axle, one of the mechanical powers, consisting in its primary form of a cylindrical axle on which a wheel, concentric with the axle, is firmly fastened. By reference to figs. 1, 2, it will be seen that this power resolves itself into a lever of the

first order, in which the weight and power are at the ends, and the fulcrum between them. *O* is the centre or fulcrum; *A* and *C* are the semi-diameters of the wheel and the axle, and on the principle of the lever the power is to the weight as *AC* is to *CA*. The wheel is grooved and carries a coil of rope, another rope is secured to the axle, and when the power is in motion, every revolution of the wheel raises the weight to a height equal to the circumference of the axle or cylinder. In a great many cases a crank takes the place of the wheel, and the circumference described by the handle is substituted for the circumference of the wheel. The power is increased by enlarging the wheel or lengthening the arm of the crank, or by diminishing the diameter of the cylinder, but there is a limit beyond which the increase cannot be obtained with safety. There is a modification of the wheel and axle, called the *double axle machine* or differential windlass, in which the power can be increased with more safety. This is shown in fig. 3, where *b* and *c* are two cylinders of different diameters, firmly fixed on the axle carrying the crank. The rope is coiled round the smaller cylinder, carried through a pulley supporting the weight, and then attached to the large cylinder in a contrary direction. When in motion every turn of the crank lifts the weight to a height equal to half the difference between the circumferences of the two axes, and the power is therefore to the weight as this half difference is to the circumference of the power, or the circle described by the crank *a*. Hence the power is increased by making the axes more nearly of the same diameter; but there is a limit to this increase, since if *b* and *c* came to be of equal thickness, the weight would not rise at all, the rope, in that case, wound upon *b* being only equal to that unwound from *c*. (See under DIFFERENTIAL.) The wheel and axle is sometimes called the *perpetual lever*, in consequence of the power being continued by the revolution of the wheel. The common winch, the windlass, the capstan, and the treadmill are so many applications of the wheel and axle. *Wheels within wheels*, a complication of circumstances, motives, influences, or the like.

It is an observation that after this necessary review the king's affairs went backwards, wheels without wheels took place. Rogers North.

—*Whispering gallery or dome*, a gallery or dome in which the sound of words uttered in a low voice or whisper is communicated to a greater distance than under any ordinary circumstances. Thus in an elliptical chamber, if a person standing in one of the foci speak in a whisper he will be heard distinctly by a person standing in the other focus, although the same sound would not be audible at the same distance under any other circumstances or at any other place in the chamber. The reason is that the sounds produced in one of the foci of such a chamber strike upon the wall all round, and, from the nature of the ellipse, are all reflected to the other focus. This serves in some measure to explain the effects of *whispering galleries* and domes in general.

**Whist** (whíst), *n.* A well-known game at cards, said to be so called because the parties playing it have to be *whist* or silent, but this is doubtful. Another name was *whisk*. The game is played with the full pack of fifty-two cards by four persons, two being partners against the other two, each player receiving thirteen cards dealt out one by one in rotation. The last card dealt is turned face up, and is called the trump card; it gives a special power to the suit to which it belongs. The cards rank as follows: ace (highest), king, queen, knave, and the others according to their number of pips. Play is commenced by the person on the left hand of the dealer laying down a card face up on the table, the other players following in succession with cards of the same suit if they have them. When all have played the player who has laid the highest card takes the four cards laid down, which constitute a trick. The winner of the trick then leads, as the first of a new trick, the winner of which becomes the leader, and so on. When a player cannot play a card of the same suit, he may play one of the trump suit, and take the trick, or lay one of a different suit, which gives him no chance of winning the trick. When the hand is played out the score is taken as follows: the partners who conjointly gain the majority of tricks score one point for every trick taken above six. The ace, king, queen, and knave of the trump suit are called honours, and count one each for the side who holds them; if one side hold three honours, they count two by honours, as the opposite side can have but one; if one side hold all the honours, four by honours is counted; should the honours be equally divided neither side counts, the honours being then said to cancel each other. In *long whist*, an obsolescent form of the game, ten of these points made a game. In *short whist*, the game now

generally played, the number has been reduced to five, and in this form it is common to count by tricks alone. A rubber consists of a series of three games, and is won by the side that secures two of them. Should one party gain two games in succession, the third of the rubber is not played.

Though that her jesses were my dear heart-strings  
I'd *whistle* her off, and let her down the wind,  
To prey at fortune. *Shak.*

Lith. and O. Prus. *kas*, Rus. *koi*, L. *qui*, Gr. *hos*, *pos*, W. *pyw*, Gael. and Ir. *co*, Per. *ki*. Skr. *kas*—*who*. *Whose*, *whom*, are found as relatives about the end of the twelfth century; 'but who not until the fourteenth century, and was not in common use before the sixteenth century.' *Dr. Morris*. In genuine idiomatic Scotch *who* or *wha* (including also the possessive and objective) is still only an interrogative, *that* or 'at being the relative. Akin are *when*, *where*, *whither*, *which*, &c.] A relative and interrogative pronoun always used substantively (that is, not joined with a noun), and with relation to a person or persons. It remains uninflected for number, but has the form *whom* for the objective and *whose* for the possessive. (*Whose* is also used for the possessive of which or that used as a rela-

tive.) (a) Used interrogatively *who* = *what* or *which person or persons*?

*Who* hath we? *who* hath sorrow? *who* hath contentions? *Prov. xlii. 15.*

*Whom* have I in heaven but thee? *Ps. lxxiii. 25.*

In such a sentence as, I do not know *who* you are, *who* is the indirect or dependent interrogative. (b) Used relatively = *that*.

I sought him *whom* my soul loveth. *Cant. iii. 1.*  
Happy the man, and happy he alone,  
He *who* can call to-day his own. *Dryden*.

(c) Sometimes used elliptically for *he*, *they*, or *those*, *who* or *whom*.

*Who* talks much must talk in vain. *Gay*.  
*Whom* the gods love die young. *Byron*.

—*As who should say*, as one who should say; as if he should say.

He wisely look'd on me  
As *who should say* 'I would thou wert the man.' *Shak.*

—*Who, Which, That*. These agree in being relatives, *who* being used for persons, *which* for things, and *that* being used indifferently for either. *Who* and *which* have well-defined different uses: (a) they connect two co-ordinate sentences; as, I met a policeman who showed me the way; I studied geometry which I found useful. Each of these sentences could be turned into two propositions grammatically, as well as logically, independent: I met a policeman and he showed me the way; I studied geometry and it I found useful. Another use of the same nature is when the second clause is of the kind termed adverbial, where we may still resolve *who* and *which* into a personal or demonstrative pronoun and a conjunction; as, why should we condemn James *who* (for he, seeing that he) is innocent? why should we study phenology *which* (seeing that it) is pointless? (b) They are often used to introduce subordinate or adjectival clauses, which serve to define or explain a noun regarding which a statement is made in the principal clause; as, I saw the man *who* first taught me to swim; the house *which* he built still stands. Now, in these latter uses, *who* and *which* cannot be turned into *and he*, and *it*. The following sentence, standing alone, is ambiguous: 'I re-read the book *which* gave me much pleasure.' This may mean either that the re-reading gave much pleasure, and in that case the sentence consists of two co-ordinate sentences and belongs to section (a), or it may mean I re-read the book which when formerly read gave me much pleasure. In the latter case the second clause limits or explains the object of the first and belongs to section (b). To remove such ambiguity, and the unpleasant effect arising from the too frequent use of *who* and *which*, it has been proposed by some grammarians (especially Professor Bain) always to employ *that* and not *who* or *which*, when the relative is used to introduce a restrictive or adjectival clause, and instead of saying 'the man *who* hath no music in himself . . . is fit for treasons, &c.' they are the books . . . which nourish all the world', to say, as *Shakespeare* says, 'the man *that* hath, &c.' they are the books . . . *that* nourish, &c., reserving *who* and *which* for such cases as are noticed under section (a). See also *THAT*.

It is the largest of the species found in Britain. The term *wild-geese* is also promiscuously applied to several species of the goose kind found wild in Britain, as *A. palustris*, *A. cygnus*, and *A. boschas*. The wild-geese of North America, also migratory, is a distinct species, the *A. cygnus* or *canadensis*. — *Wild-geese* chase, the pursuit of anything in ignorance of the direction it will take, hence, a foolish pursuit or enterprise. That faculty or power of the mind by which we determine either to do or not to do something which we conceive to be in our power; the faculty which is exercised in deciding, among two or more objects, which we shall embrace or pursue; the power of producing acts of willing; the power of control which the mind possesses over its own operations.

Appetite is the will's solicitor, and the will is appetite's controller; what we covet according to the one, by the other we often reject. Hooker.

Every man is conscious of a power to determine in things which he conceives to depend upon his determination. To this power we give the name of will. Reid.

2. The act of willing; the act of determining choice or forming a purpose; volition.

It is necessary to form a distinct notion of what is meant by the word 'volition' in order to understand the import of the word 'will,' for this last word expresses the power of mind of which volition is the act. The word 'will' however, is not always used in this its proper signification, but is frequently substituted for 'volition,' as when I say that my hand moves in obedience to my will. D. Stewart.

Is of the same opinion still. Hudibras.

*Inclination* is another word with which *will* is frequently confounded. Thus, when the apothecary says in *Romeo and Juliet*:

My poverty and not my will consents, &c. the word *will* is plainly used as synonymous with *inclination*, not in the strict logical sense, as the immediate antecedent of action. It is with the same latitude that the word is used in common conversation, when we speak of doing a thing which duty prescribes, against one's own will; or when we speak of doing a thing willingly or unwillingly.

D. Stewart.

7. In law, the legal declaration of a man's intentions as to what he wills to be performed after his death in relation to his property; a testament. In England no will, whether of real or personal estate, is to be valid unless it be in writing, and signed at the foot or end by the testator, or by some person in his presence, and by his direction. Such signature must be made or acknowledged by the testator in the presence of two or more witnesses present at the same time, and such witnesses must attest and subscribe the will in the presence of the testator. Soldiers on actual service, or mariners at sea, have the power of making *nuncupative wills*. In the United States the law is in substantial agreement with that of England. In Scotland formerly only personal property could be disposed of by will, real property being conveyed by a disposition or deed in which the testator's interest in the subject was reserved, but heritable property can now be so disposed of. — *Good will*, (a) favour; kindness. (b) Right intention. Phil. i. 15. — *Ill will*, enmity; unfriendliness. It expresses less than malice. See GOOD-WILL and ILL-WILL. — *To have one's will*, to obtain what is desired. — *To work one's will*, to act absolutely according to one's own will, wish, pleasure, or fancy; to do entirely what one pleases with something.

For though the Great Ages leave the hill

And break the shore, and evermore

Make and break and work their will. . . .

He threw himself into the business with a will.

Dickens.

**Will** (wil), *v. aux.*, pres. I will, thou wilt, he will; past. would; no past participle. [A. Sax. *wilian*, pres. sing. 1 and 3 *wile*, 2 *will*, pl. *willaht* (1, 2, and 3); pret. *wolde*, *woldast*; pl. *woldon* or *woldan*; D. *willen*, Icel. *villa*, Dan. *vill*, to will; G. *will*, I will, he will, infin. *wollen*; Goth. *villian*; cog. L. *volo*, I will, *velle*, to will; Gr. *boulomai*, I will. Akin *well*, *weal*, *wild*.] A word denoting either simple futurity or futurity combined with volition according to the subject of the verb. Thus, in the first person, I (we) will, the word denotes willingness, consent, intention, or promise; and when emphasized it indicates determination or fixed purpose; as, I will go, if you please; I will go at all hazards; I will have it in spite of him. In the second and third persons *will* expresses only a simple future or certainty, the idea of volition, purpose, or wish being lost; thus, 'you will go,' or 'he will go,' indicates a future event only. The second person may also be used as a polite command; as, you will be sure to do as I have told you. — As regards *will* in questions Mr. R. Grant White lays down the following rules: 'Will is never to be used as a question with the first person; as, will I go? A man cannot ask if he wills to do anything that he must know and only he knows. . . . As a question, will in the second person asks the intention of the person addressed; as, will you go to-morrow? that is, Do you mean to go to-morrow? . . . As a question, will in the third person asks what is to be the future action of the person spoken of, with a necessary reference to intention; as, will he go? that is, Is he going? Does he mean to go and is his going sure? Simple futurity with the first person is appropriately expressed by *shall*. (See SHALL.) Among inaccurate speakers and writers, especially in Scotland, Ireland,

and in some parts of the United States, there is some confusion in the use of *shall* and *will*; thus *will* improperly takes the place of *shall* in such frequently used phrases as, 'I will be obliged to you,' 'we will be at a loss,' 'I will be much gratified,' and so on.

*Would* stands in the same relation to *will* that *should* does to *shall*. Thus *would* is seldom or never a preterite indicative pure and simple, being mainly employed in subjunctive, conditional, or optative senses, in the latter case having often the functions and force of an independent verb; as, (a) conditional or subjunctive, 'he would do it if he could,' 'he could do it if he would,' 'they would have gone had they been permitted.' Here it will be seen *would* refers to the present only, the past being expressed by *would have*. In such sentences as 'He was mistaken it would seem,' or 'it would appear'—in which *would* is sometimes used—*would* retains almost nothing of conditionality, having merely the effect of softening a direct statement. (Mr. R. Grant White regards 'it should seem' as the normal expression, though he quotes 'it would appear' from good English writers. He himself writes, 'It would seem that a man of Mr. Lowe's general intelligence should know.' *Every-day English*, chap. xiii.) (b) Optative; 'I would that I were young again.' In this use the personal pronoun is often omitted. 'Would to God we had died in Egypt.' Ex. xvi. 3. 'Would God I had died for thee, O Abesalom.' 2 Sam. xviii. 3. 'Would thou wert as I am.' *Shak.*—*Would* most nearly has the force of a simple past indicative in such sentences as, 'he would go and you see what has happened,' but this implies farther that he did actually go or at least set out, and the *would* is here emphatic.—*Would* is also used to express a habit or custom, as if it implied a habitual exercise of will; as, she would weep all day; every other day he would fly into a passion.—*Will* and *would* were formerly often used with adverbs and prepositional phrases to express motion or change of place, where modern usage would require *will go*, *would go*, or the like. 'Now I will away,' 'I'll to the ale-house,' 'I will about it,' 'I'll to my books,' 'he is very sick and would to bed,' 'there were wit in this head, an 'twould out.' *Shak.*—What may be called a similar elliptical usage occurs in such phrases as 'what would you?' where present usage would supply *have* or *do*.

**Willow (wil'ló), n.** [A Sax. *wealg*, *welig*, D. *wilg*, L.G. *wilge*, a willow; probably from root of *wallow*, L. *wolvo*, to roll, from the flexibility of its twigs.] 1. The common name of different species of plants belonging to the genus *Salix*, the type of the natural order Salicaceae. The species of willows are numerous, about 160 having been described, many of which are British. They are all either trees or bushes, occurring abundantly in all the cooler parts of the northern hemisphere. They grow naturally in a moist soil, and wherever planted they should be within the reach of water. On account of the flexible nature of their shoots, and the toughness of their woody fibre, willows have always been used as materials for baskets, hoops, crates, &c. The wood is soft, and is used for wooden shoes, pegs, and the like; it is also much employed in the manufacture of charcoal, and the bark of them all contains the tanning principle. The Huntingdon or white willow (*Salix alba*) and the Bedford willow (*S. Russelliana*) are large trees, yielding a light soft timber, valuable for resisting the influence of moisture or damp. The weeping willow (*S. babylonica*) is a native of China, and is a fine ornamental tree. The willow has for long been considered as symbolical of mourn-

ing, grief, bereavement, forsakenness, or the like.

Tell him, in hope he'll prove a widower shortly, I'll wear the *willow* garland for his sake. *Shak.*

**Wind** (wînd, in poetry often *wînd*), n. [A. Sax. *D. and G. wind*, *Dan. sw. vind*, *icel. vindr*, Goth. *wînde*; cogn. *L. ventus*, *W. gwynn*, *wind*. The root is in *Goth. wînd*, *ikr* ed, to blow. *Weather* is from same root.] 1. Air naturally in motion with any degree of velocity; a current of air; a current in the atmosphere, as coming from a particular point. When the air moves moderately, it is called a light wind or a breeze, when with more velocity, a fresh breeze, and when with violence, a gale, storm, tempest, or hurricane. The principal cause of these currents of air is the disturbance of the equilibrium of the atmosphere by the unequal distribution of heat. When one part of the earth's surface is more heated than another, the heat is communicated to the air above that part, in consequence of which the air expands, becomes lighter, and rises up, while colder air rushes in to supply its place, and thus produces wind. As

the heat of the sun is greatest in the equatorial regions, the general tendency there is for the heavier columns of air to displace the lighter, and for the air at the earth's surface to move from the poles toward the equator. The only supply for the air thus constantly abstracted from the higher latitudes must be produced by a counter-current in the upper regions of the atmosphere, carrying back the air from the equator towards the poles. The quantity of air thus transported by these opposite currents is so nearly equal, that the average weight of the air, as indicated by the barometer, is the same in all places of the earth. Besides the unequal distribution of heat already mentioned, there are various other causes which give rise to currents of air in the atmosphere, such as the condensation of the aqueous vapours which are constantly rising from the surfaces of rivers and seas, and the agency of electricity. Winds have been divided into *fixed or constant*, as the trade winds; *periodical*, as the monsoons; and *variable winds*, or such as blow at one time from one point, at another from another point, and at another time cease altogether. (See TRADE-WIND, MONSOON.) There are also various local winds, which receive particular names; as, the *Etesian wind*, the *Sirocco*, the *Simoom*, the *Harmattan*, the *Mistral*, *Typhoon*, &c. (See these terms.) The velocity and force of the wind vary considerably, as shown by the anemometer. Thus a light wind travelling at the rate of 5 miles an hour exercises a pressure of 2 oz. on the square foot; a light breeze of 10 miles an hour has a pressure of 8 oz.; a good steady breeze of 20 miles, 2 lbs.; a storm of 60 miles, 18 lbs.; a violent hurricane of 100 miles, 50 lbs., a pressure which sweeps everything before it. Winds are denominated from the point of compass from which they blow; as, a *north wind*, an *east wind*, a *south wind*, a *west wind*, a *south-west wind*, &c.

Except *wind* stands as it has never stood. It is an ill *wind* that turns none to good. *Tusser*.

The name is, however, generally restricted to the orchestral instruments of the second class, consisting of a tube (straight, bent, or curved), producing a fundamental tone with its harmonics or overtones when the vibrating column extends the whole length of the tube. This column may, however, be shortened by having holes of certain size and at certain distances along the tube, which are opened or stopped by the fingers or valves, the instrument being thus adapted to produce in its simpler forms the tones of the diatonic scale and in its more complex forms the tones of the chromatic scale. The wind instruments of an ordinary orchestra are divided into two classes. Wood instruments, as the flute, oboe, clarinet, and bassoon and brass instruments, as the horn, cornet a piston, trombone, euphonium, bombardon, and euphonium. The quality of tone of the woods is soft, smooth, light, and almost vocal, that of the brasses is somewhat harder, more powerful and majestic. Brass all fixed tuned they cannot, of course, play in perfect tune like

stringed instruments, and they can only produce one sound at a time.

lar frames to the extremities of the principal axis or wind-shaft of the mill, which is placed nearly horizontal, so that the sails, by the action of the wind, revolve in a plane nearly vertical, giving a rotary motion to the driving-wheel *n* fixed to the wind-shaft, and thus conveying motion to the vertical shaft *y* and the machinery connected with it. The extremity of the wind shaft must always be placed so as to point to the quarter from which the wind blows. To effect this some mills have a self-adjusting cap *b*, which is turned round by the force of the wind acting upon the fan or *flyer* *c*, attached to the projecting frame-work at the back of the cap. By means of a pinion on its axis, motion is given to the inclined shaft and to the wheel *p* on the vertical spindle of the pinion *a*, this latter pinion engages the cogs on the outside of the fixed rim of the cap, by these means the sails are kept constantly turned to the wind, the head of the mill moving slowly round the moment any change in the direction of the wind causes the fan *c* to revolve. In the horizontal windmill the wind shaft is vertical, so that the sails revolve in a horizontal plane. The effect of horizontal windmills, however, is considered to be far inferior to that of the vertical kind. The effect of windmills depends greatly upon the form and position of the sails. See also **POST-MILL**.—3. A visionary scheme; a vain project, a fancy; a chimera.

1. The fermented juice of the grape or fruit of the vine (*Vitis vinifera*. See *VITIS*). Wines are distinguished practically by their colour, hardness or softness on the palate, their flavour, and their being still or effervescing. The differences in the quality of wines depend partly upon differences in the vines, but more on the differences of the soils in which they are planted, in the exposure of the vineyards, in the treatment of the grapes, and the mode of manufacturing the wines. When the grapes are fully ripe, they generally yield the most perfect wine as to strength and flavour. The leading character of wine, however, must be referred to the alcohol which it contains, and upon which its intoxicating powers principally depend. The amount of alcohol in the stronger ports and sherries is from 16 to 25 per cent; in hock, claret, and other light wines from 7 per cent. Wine containing more than 18 per cent of alcohol may be assumed to be fortified with brandy or other spirit. The most celebrated ancient wines were those of Lesbos and Chios among the Greeks, and the Falernian and Cecuban among the Romans. The principal modern wines are Port, Sherry, Claret, Champagne, Madeira, Hock, Marsala, &c. &c. The varieties of wine produced are almost endless, and differ in every constituent according to the locality, season, and age; but generally the produce of each vineyard retains its own leading characteristics. The principal wine-producing countries are France, Germany, Spain, Portugal, Sicily, Greece, Cape Colony, Australia, and America.—2. 1. One of the anterior limbs in birds, corresponding to the arms in man, and in most cases serving as organs by which flight is effected, though in some birds they merely aid in running or swimming. Normally the wings consist of the bones of the fore-limbs, specially modified and provided with feathers. To that part of the limb analogous to the hand are attached the primaries or greater quill-feathers, the secondaries are affixed to the forearm, and the arm supports the tertiaries and scapulars. The bone which represents the thumb gives rise to the bastard quills, and along the base of the quills are ranged the wing-coverts. Wings are attributes of some of the gods of antiquity, of demons, and of many imaginary beings. In Christian art the use of wings is limited to angels and devils.—2. An organ used for flying by some other animals. In insects, the wing is formed of two delicate skin layers, supported on hollow tubes or nervules placed in communication with the respiratory system. The wings of *bats* consist of a fold of skin which commences at the neck and extends on each side between the fore-legs or arms and the posterior limbs. **Wis** (wis), erroneously given in many dictionaries as a verb, with the pret. *wis*, and defined, to know, to be aware, to think, &c. But *wis* belongs to *wit*, to know (see **WIT**), and there never was a real verb *wis*, to know. The error seems to have arisen from the adverb *Y-wis*, *i-wis* (certainly), being frequently written with the prefix apart from the rest of the word, and often with a capital letter so as to appear as *Y wis*, or *I wis*; hence the *I* was mistaken for the first personal pronoun, and the verb *wis* created. It is often nearly synonymous with *discretion*, or with *prudence*, but both of these are strictly only particular phases of wisdom. Wit in poetry . . . is no other than the faculty of imagination in writing, which searches over all the memory for the species or ideas of those things which it designs to represent. *Dryden.*

6. The faculty of associating ideas in a new and ingenious, and at the same time natural and pleasing way exhibited in apt language; the felicitous combination of words and thoughts by which unexpected resemblances between things apparently unlike are vividly set before the mind so as to produce a shock of pleasant surprise; facetiousness.

Wit lies most in the assemblage of ideas, and putting these together with quickness and variety, wherein can be found any resemblance or congruity, thereby to make up pleasant pictures and agreeable visions to the fancy. *Locke.*

True wit consists in the resemblance of ideas. . . . But every resemblance of ideas is not what we call wit, and it must be such one that gives delight and surprise to the reader. Where the likeness is obvious, it creates no surprise, and is not wit. Thus, when a poet tells us that the loom of his mistress is as white as snow, there is no wit in the comparison; but when he adds, with a sigh, it is as cold too, it then grows into wit. *Dryden.*

True wit is nature to advantage dress'd. What oft was thought, but ne'er so well express'd. *Pepe.*

[The two extracts following bear on the distinction between wit and humour.]

Dr. Trusler says that wit relates to the matter, humour to the manner; that our old comedies abounded with wit, and our old actors with humour; that humour always excites laughter but wit does not; that a fellow of humour will set a whole company in a roar, but that there is a smartness in wit, which cuts while it pleases. Wit, he adds, always implies sense and abilities, while humour does not; humour is chiefly relied by the vulgar, but education is requisite to comprehend wit. *Fleming.*

It is no uncommon thing to hear 'He has humour rather than wit.' Here the expression commonly means pleasant; for whoever has humour has wit, although it does not follow that whoever has wit has humour. Humour is wit appertaining to character, and indulges in breadth of drollery rather than in play and brilliancy of point. Wit vibrates and spirits; humour springs up exuberantly as from a fountain and runs on. In Congress you wonder what he will say next; in Addison you repose on what is said, listening with assured expectation of something congenial and pertinent. The French have little humour, because they have little character; they excel all nations in wit because of their levity and sharpness. *Lander.*

Indeed it was fully believed that they gave themselves up to him, body and soul, while he engaged that they should want for nothing, and be able to assume whatever shape they pleased, to visit and torment their enemies, and accomplish their infernal purposes. As soon as the bargain was concluded, the devil was said to deliver to the witch an imp or familiar spirit, to be ready at call, and to do whatever it was directed. By the aid of this imp and the devil together, the witch, who was almost always an old woman, was enabled to transport herself through the air on a broomstick, and to transform herself into various shapes, particularly those of cats and hares; to inflict diseases on whomsoever she pleased, and to punish her enemies in a variety of ways. The belief in witchcraft is very ancient. It was a common belief in Europe till the sixteenth century, and maintained its ground with tolerable firmness till the middle of the seventeenth century; indeed it is not altogether extinct even at the present day. Numbers of reputed witches were condemned to be burned, so that in England alone it is computed that no fewer than 30,000 of them suffered at the stake. —2. Bulg. *wulfu*, Lith. *wulfu*, L. *lupus*, Gr. *lukos* (both with loss of the initial *l*), Skr. *writra*—wolf, all traced to a root *walk* meaning to tear.] 1. A quadruped belonging to the digitigrade carnivora, family Canide, in habits and physical development closely related to the dog, some naturalists, indeed, considering it as the progenitor of some existing races of the dog, with which it has been known to interbreed. The common European wolf (*Canis lupus*) is yellowish or fulvous gray, the hair is hard and strong, the ears erect and pointed, the tail straight, or nearly so, and there is a blackish band or streak on the forelegs about the carpus. The height at

the shoulder is from 27 to 29 inches. The wolf is swift of foot, crafty, and rapacious; a destructive enemy to the sheep-cote and farm-yard; it associates in packs to hunt the larger quadrupeds, such as the deer, the elk, &c. When hard pressed with hunger these packs have been known to attack isolated travellers, and even to enter villages and carry off children. In general, however, wolves are cowardly and stealthy, approaching the sheepfolds and farmsteads only at dead of night making a rapid retreat if in the least scared by a dog or a man, and exhibiting great cunning in the avoidance of traps. Wolves are still plentiful in some parts of Europe, as France, Spain, Italy, Germany, Turkey, and Russia, they probably ceased to exist in England about the end of the fifteenth century, the last of their race in Scotland is said to have been killed by Cameron of Lochiel in 1680, while in Ireland they are known to have existed until at least the beginning of the eighteenth century. The black wolf (*C. occidentalis*) of America is a larger and fiercer animal than his European congener. The little prairie-wolf or coyote (*C. caryacus*), abounding on the vast plains of Missouri and Mexico, is a harrowing animal, and resembles in many respects the jackal. The

blunt grinders adapted for crushing the molluscs and crustaceans on which it feeds. The ventral fins are absent; the colour is

Wolf-hub (*Amarrhichas lupus*).

browless-gray, spotted, and striped with brown over the upper parts, while the belly is white. The flesh is palatable, and largely eaten in Iceland, whilst the skin is durable, and manufactured into a kind of shagreen. When drawn up in a net it attacks its captors ferociously, and unless stunned with a blow on the head, is capable of doing great damage to both persons and nets with its powerful teeth. Called also *Sea-out*, *Cat-fish*, and *Sea-wolf*.

**Wolfman** (wulf'man), *s.* Pertaining to or promulgated by Frederick A. Wolf, the great German philologist. — *Wolfian theory*, a theory put out by Wolf in 1795 to the effect that the *Iliad* and *Odyssey* cannot be the works of one man, Homer, because writing was unknown at the time that these poems are said to have been composed. He supposes, therefore, that the *Iliad* and *Odyssey* consist of ballads or episodes, the work of different men, collected and arranged in a more or less consistent and homogeneous whole in the sixth century B.C. These ballads were preserved by the recitation of strolling minstrels.

It is a native of alpine pastures in Switzerland and other mountainous parts of Europe. It is a common plant in flower borders, and is found in a wild state in one or two parts of England. All the parts of the plant, espe-

cially the roots, are very poisonous, containing a narcotic alkaloid called *aconitin* or *aconitine*, one of the most virulent of all known poisons. The juice of the leaves introduced into the stomach is said to occasion death in a short time, but the powdered root is far more energetic. ## X.

**X**, the twenty-fourth letter of the English alphabet, was borrowed by the Romans in comparatively late times from the Greeks, and passed from the Roman into the Anglo-Saxon alphabet. The Greek *X*, however, was a guttural, probably like the Scotch or German *ch*, and why in Latin it should have assumed the functions of the Greek character *χ* (= *ch*) is not very clear. Except when used at the beginning of a word, *x* in English

is a double consonant (as it was in Latin and Greek), and has usually the sound of *ks*, as in *was*, *tax*, *axis*, &c., but when terminating a syllable, especially an initial syllable, if the syllable following it is open or accented, it often takes the sound of *gz*, as in *luxury*, *exhaust*, *exasp*, *exasp*, &c. At the beginning of a word it has precisely the sound of *x*. Hence it is entirely a superfluous letter, representing no sound that could

not easily be otherwise represented. As an initial it occurs in a few words borrowed from the Greek, never standing in this position in words that are properly English in origin.—As a numeral *X* stands for ten. It represents one *V*, which stands for five, placed above another, the lower one being inverted. When laid horizontally, thus *M*, it stands for a thousand, and with a dash over it, thus *X̄*, it stands for ten thousand.

## Y.

**Y**, the twenty-fifth letter of the English alphabet, was taken from the Latin, the Latin having borrowed it from the Greek *Υ* or upsilon. In the Anglo-Saxon alphabet it was always a vowel, and is believed to have had a sound resembling that of French *u* or German *ü*, this being also the sound which the Greek *Υ* is believed to have had. In modern English it is both a consonant and a vowel, and seldom or never is the historical representative of A. Sax. *y*, this being usually represented by *i*. At the beginning of syllables and followed by a vowel it is a consonant of the palatal class, being formed by bringing the middle of the tongue in contact with the palate, and nearly in the position to which the *g* hard brings it. Hence it has happened that in a great number of words *y* has been softened into *i*, as A. Sax. *gedr* into *year*, *geornian* into *yearn*, *dag* into *day*. As an adjective termination it commonly represents A. Sax. *-ig*, as in *stony* = A. Sax. *stānig*, *greedy* = A. Sax. *grædig*, *hungry* = A. Sax. *hungrig*, *many* = A. Sax. *manig*. In some nouns it also represents the term *-ig*, as in *honey* = A. Sax. *hunig*, *withy* = A. Sax. *withig*. In the term *-ly* it stands for *ic* or *ice*, as in *godly* = A. Sax. *godlic*, *friendly* = A. Sax. *frēondlic*, *fully* = A. Sax. *fullice*, *hardly* = A. Sax. *hardlice*, &c. In words of Romance origin the term *-y* often represents Fr. *-ie*, L. *-ia*, as in *history*, *modesty*, *memory*, *victory*; it also represents

L. *-ium*, the noun termination, as in *study*, *remedy*, *subsidy*, &c., or the adjective term. *-ius*, as in *notary*, *contrary*, *secondary*, &c. In nouns ending in *-ty* the *-ty* represents Fr. *-té*, L. *-tas*, *-tatis*, as in *vanity*, *calamity*, &c. In the middle and at the end of words *y* is a vowel, and is precisely the same as *i*. It is sounded as *i* long, when accented, as in *defy*, *rely*, *dying*; and as *i* short when unaccented, as in *vanity*, *glory*, *synonymous*. As a consonant this letter bears much the same relation to *i* (short) as *w* does to *u*; thus *i* short has in certain positions—as in the *ia* of *Christian*—a tendency to pass into *y*. *Y* is sometimes called the Pythagorean letter, from its Greek original representing, by means of its three limbs, the sacred triad, formed by the dual proceeding from the monad.—In chem. *Y* is the symbol of yttrium.—*Y*, as a numeral, stands for 160, and with a dash over it, *Ȳ*, for 150,000.

**Y-** A common prefix in Old English words, as in *y-clept*, *y-clad*, &c., representing A. Sax. *ge-*, which assumed this form by the common weakening of *g* to *y*. The meaning of words with this prefix is usually the same as if it were absent. See *GE*.

**Yacht** (yot), *n.* [O. D. *yacht*, Mod. D. *jagt*, a yacht, a chase, hunting, from *jagen*, to chase, to hunt, to hurry; *G. jagen*, to hunt; *Dan. jage*, to hunt, to drive, to hurry.] A light and elegantly fitted vessel, used either for pleasure trips or racing, or as a vessel of state to convey kings, princes, &c., from one place to another by sea. There are two distinct species of yacht: the mere racer with enormous spars and sails and deeply-ballasted hull, with fine lines, but sacrificing everything to speed; and the elegant, commodious, well-proportioned travelling yacht, often with steam-propelling machinery, fit for a voyage round the world. The yacht navy of Britain comprehends vessels from 3 to about 600 tons.

There are several varieties of the yak due to climatic influences, character of habitat, food, and, in the case of domesticated animals, to the kind of work to which they are put, as the noble yak, the chain-ox, the plough-yak. The last is a plebeian-looking animal, and wants the magnificent side tufts of hair characteristic of its free brethren. It is employed in agriculture. The yak is often crossed with other domestic cattle, and a mixed breed obtained. The tail of the yak is in great request for various ornamental purposes, and forms quite an important article of commerce. Dyed red it decorates the caps of the Chinese, and when properly mounted it is used as a fly-flapper in India under the name of a chowry

dian yams are produced by *D. glabosa*, *rubella*, and *purpurea*. The *D. atro-purpurea* grows in Malacca, and produces tubers which, like those of *D. purpurea*, are of a purple colour. of departed spirits and the appointed judge and punisher of the dead, the embodiment of power without pity, and stern, unbending fate. He is generally represented as crowned and seated on a buffalo, which he guides by the horns. He is four-armed and of austere countenance. In one hand he holds a mace, in another a noose which is used to draw out of the bodies of men the souls which are doomed to appear before his judgment-seat. **Yank** (yank), *n.* [Contr. of *Fankee*.] A Yankee. [Vulgar.]

**Yankee** (yā'kē), *n.* [A word of uncertain origin. The most common explanation seems also the most plausible, namely, that it is a corrupt pronunciation of *English* or of *Fr. Anglois* formerly current among the American Indians. In Bartlett's *Dictionary of Americanisms* a statement is quoted to the effect that *Yankees* or *Yenkees* was a name originally given by the Massachusetts Indians to the English colonists, and that it was afterwards adopted by the Dutch on the Hudson, who applied the term in contempt to all the people of New England. Bartlett also quotes a statement of Heckwelder (an authority on Indian matters), who affirmed that the Indians applied the term *Yankees* specially to the New Englanders as contradistinguished from the Virginians or Long Knives, and the English proper or Saggenash. As early as 1713 it is said to have been a common cant word at Cambridge, Mass., in the sense of good or excellent, being probably borrowed by the students from the Indians, to whom a 'Yankee' article would be synonymous with an excellent one, from the superiority of the white man in mechanical arts.] A cant name for a citizen of New England. During the American Revolution the name was applied to all the insurgents, and during the civil war it was the common designation of the Federal soldiers by the Confederates. In Britain the term is sometimes applied generally to all natives of the United States.

**Yankee-Doodle** (yā'kē-dō'dil), *n.* 1 A famous air, now regarded as American and national. In reality the air is an old English one, called *Nantley Doodle*, and had some derisive reference to Cromwell. It is said that the brigade under Lord Percy, after the battle of Lexington, marched out of Boston playing this tune in derisive and punning allusion to the name Yankee, and the New Englanders adopted the air in consideration of the fact that they had made the British dance to it. The really national tune of the whole United States, however, is 'Hail, Columbia.' — 2 A Yankee. 'Hot Yankee-doodles!' *Moore.* [Ludicrous.]

**Yankeeism** (yā'kē-izm), *n.* An idiom or practice of the Yankees.

It is aquatic in its habits, bearing a considerable resemblance to a small otter, and differs from other opossums in its dentition, in having no opposable thumb, and, therefore, in being incapable of climbing trees, and in the toes of the hind feet being webbed. It is an excellent swimmer, and lives on the fishes which it chases and catches in the rivers. Called also *Water-opossum*.

**Yapon** (yā'pōn or yā'pōn), *n.* *Flex Cassine*, a shrub growing in the southern states of America, the leaves of which are used as tea and as medicine. The same name is also given to other species of *Flex*. Written also *Yapoun*.

used only in answer to questions framed affirmatively in contradistinction to *yes* and *no*, which were the proper answers to questions put negatively. See *extract*.

There is an example of the rejection of a needless subtlety in the case of our affirmative particles, *yes* and *yes*, *may* and *no*, which were formerly distinguished in use, as the two affirmatives still are in our sister-tongues, the Danish and Swedish. The distinction was that *yes* and *may* were answers to questions framed in the affirmative; as, Will he go? *Yes* or *May*. But if the question was framed in the negative, Will he not go? the answer was *Yes* or *No*.

Perhaps from root *i*, to go, seen in *yode*, L. *eo*, *ire*, to go.] 1. The period of time during which the earth makes one complete revolution in its orbit; or it is the space or period of time which elapses between the sun's leaving their equinoctial point, or either tropic, and his return to the same. This is the *tropical* or *solar* year, and the year in the strict and proper sense of the word. This period comprehends what are called the twelve calendar months, and is usually calculated to commence on 1st January and to end on 31st December. It is not quite uniform, but its mean length is about 365 days, 5 hours, 48 minutes, and 51.8 seconds. The return of the seasons depends upon it. In popular usage, however, the year consists of 365 days, and every fourth year of 366. See *BISSEXTILE*, *LEAP*, *YEAR*.  
— *Astronomical year*. See under *ANOMALISTIC*.  
— *Civil year*, the tropical or solar year.  
— *Common year*, a year of 365 days, as distinguished from *leap-year*.  
— *Ecclesiastical year*, from Advent to Advent. — *Gregorian year*, *Julian year*. See *GREGORIAN*, *JULIAN*, *STYLE*.  
— *Legal year*, in England, commenced on March 25, though the historical year began on January 1, a practice which continued till 1752; hence it was usual between January 1 and March 25 to date the year both ways, as 1746-6. — *Lunar year*, a period consisting of 12 lunar months. The *lunar astronomical year* consists of 12 lunar synodical months, or 354 days, 8 hours, 48 minutes, 36 seconds. The *common lunar year* consists of 12 lunar civil months, or 354 days. The *embolismic* or *intercalary lunar year* consists of 13 lunar civil months, and contains 354 days. — *Sabbatical year*. See *SABBATIC*.  
— *Sidereal year*. See *SIDEREAL*.

Myself am struck in years; I must confess. *Shak*.

Untouch'd with any shade of years,  
May those kind eyes for ever dwell. *Tennyson*.

In popular language year is often used for years; as, the horse is ten year old.

And threescore year would make the world away. *Shak*.

Skeat regards the word in meaning 2 (the only meaning found in Shakespeare) as quite different, taking it from O. E. *ernie*, to grieve, from A. Sax. *yrman*, to grieve, to vex, from *earn*, poor, wretched (D. Dan. *sw* and G. *arm*, Icel. *armr*, Goth. *arns*). If this is correct the word has evidently been influenced in its form by confusion with *yearn*, to desire.] 1. **Yeast** (yést), n. [O. E. *yeast*, A. Sax. *giest*, *giest*, Icel. *jast*, *jast*, D. *gest*, *giest*, M. H. G. *gest*, *jest*, Mod. G. *gäst*, yeast, from a verb signifying to ferment seen in O. H. G. *geasan*, *geasan*, Mod. G. *gähren*, *gäehen*, Sw. *gäsa*, to ferment, to froth. Allied to Gr. *zeo*, to boil, *zeion*, E. *zeal*.] 1. Barm; ferment; the yellowish substance, having an acid reaction, produced during the vinous fermentation of saccharine fluids, rising partly to the surface in the form of a frothy, flocculent, viscid matter (*surface yeast*), and partly falling to the bottom (*sediment yeast*). Yeast consists of aggregations of minute cells, each cell constituting a plant, *Torula cerevisia*. The yeast-plant is a fungus, or rather a particular state of fungus, for there are many moulds which, under certain conditions, acquire the *torula* property, that is, become capable of decomposing sugar. The cell consists of a cyst composed of cellulose, inclosing a semi-fluid matter, essentially identical with protein. When a surface yeast-cell has attained full size, it gives off a little bud, which, on attaining the size of

the first, gives out another bud, and in this way the cells undergo exceedingly rapid multiplication. The germs of the yeast-plant are supposed to exist in countless multitudes in the atmosphere, from the fact that a saccharine solution which presents no surface to the atmosphere does not ferment, while on its being so exposed fermentation sets in. Fermentation takes place sooner and goes on more rapidly when yeast is added than when the fluid is merely exposed to the atmosphere, beer yeast possessing the property of setting up fermentation in the highest degree. Surface yeast is formed at 65° to 77° Fahr., and its action is rapid and irregular, whereas sediment yeast is formed at 32° to 45°, and its action is slow and quiet. Sediment yeast is reproduced by spores and not by buds. In their chemical relations the two do not appear to differ. Yeast varies in quality according to the nature of the liquid in which it is generated, and yeast merchants distinguish several varieties, which are employed for different purposes according to their energy and activity. Yeast is not only essential to the production of wine from grape juice and other fruit juices, the manufacture of beer, and the preparation of distilled spirits, but it is also the agent in producing the panary fermentation whereby bread is rendered light, porous, and spongy. Beer yeast is employed medicinally as a stimulant in low fevers, and is of great service in cases where, from inflammatory symptoms, wine is inadmissible. — *German yeast*, common yeast collected, drained, and pressed till nearly dry. It can be so kept for several months, and is much used by bakers. — *Patent yeast*, yeast collected from a wort of malt and hop, and treated similarly to German yeast. — *Artificial yeast*, a dough of flour and a small quantity of common yeast made into small cakes and dried. Kept free from moisture, it long retains its fermentative property. — 2. Spume or foam of water; froth.

They melt into thy yeast of waves, which mar

The moon with her mainmast, and anon

## Z.

**Z**, the last letter of the English alphabet, is a sibilant consonant, and is merely a vocal or sonant S, having precisely the same sound that *s* has in *wise*, *peace*, *please*, &c. (See *S*.) It did not have a place in the Anglo-Saxon alphabet, though no doubt it had sometimes this sound. In old English of the fourteenth century it was common, and in some writings was often used where we now have *s*. The words in modern English which begin with *z* are all derived from other languages, mostly from the Greek. The case was the same in Latin, in which this letter was never really naturalized. When not initial, however, the case is different, and we often find it representing an older *s* in genuine English words, as in *blaze*, *crease*, *paze*, *graze*, *guzzle*, *hazard*, *siaz*, &c. As a final it occurs in some onomatopoeic words, as in *buzz*, *cozzes*. In German *z* is very common, being

a double consonant, with the sound *ts*. In Greek it was also a double consonant—*ds* or *ad*. In Britain its name is *zed*, in America *zed* and *zee*.

The stems of all the zamias abound in a mucilaginous juice, which has a nauseous odour and an unpleasant taste, arising from the existence in it of a peculiar proximate principle. This may be removed by boiling, roasting, &c., when some of them form a nutritious article of food. *Caffer-bread* is a common name for the genus in South Africa, where the central part of the stem pith of *Z. cycadis*, after being prepared in a particular way, is formed into cakes, baked, and eaten by the natives. The zebras graze in herds on the steep hill-side, and seek the wildest and most sequestered spots, so that they are extremely difficult of approach, not only from their watchful habits and great swiftness of foot, but also from the inaccessible nature of their abodes. The zebra is one of the handsomest, and also one of the wildest and least tractable of animals. Only in a few instances has it been domesticated, for it always retains its vicious, obstinate, and fickle nature. The name zebra is sometimes applied to the quagga and the dauw or Burchell's zebra; but they differ from the zebra in having no stripes on the lower limbs, while those on the body are not so black as the true zebra. **Zinc** (zingk), *n.* [Fr. *zinc*, G. *Sw.* and *Dan.* *zink*; allied to *G. zinn*, tin.] Sym. Zn. At. wt. 66. A metal frequently called *spelter* in commerce. It has a strong metallic lustre and a bluish-white colour. Its texture is lamellated and crystalline, and its specific gravity about 7. It is a hard metal, being acted on by the file with difficulty, and its toughness is such as to require considerable force to break it when the mass is large. At low or high degrees of heat it is brittle, but between 250° and 300° F. it is both malleable and ductile, and may be rolled or hammered into sheets of considerable thickness and drawn into wire. Its malleability is considerably diminished by the impurities which the zinc of commerce contains. It fuses at 773° F., and when slowly cooled crystallizes in four- or six-sided prisms. Zinc undergoes little change by the action of air and moisture. When fused in open vessels it absorbs oxygen and forms the

white oxide called *flowers of zinc*. Heated strongly in air it takes fire and burns with a beautiful white light, forming oxide of zinc. Zinc is found in considerable abundance. It does not occur in the native state, but is obtained from its ores, which are chiefly the sulphide, or *zinc-blende*, and the carbonate or *calamine*. The oxide of zinc (ZnO) is a fine white powder insoluble in water, but very soluble in acids, which it neutralizes, being a very powerful base, of the same class as magnesia. It combines also with some of the alkalies. Zinc forms a series of compounds with organic radicles, such as zinc methyl, Zn(CH<sub>3</sub>)<sub>2</sub>, and zinc ethyl, Zn(C<sub>2</sub>H<sub>5</sub>)<sub>2</sub>. Several of the salts of zinc are employed in medicine, as the sulphate or *white vitriol* (ZnSO<sub>4</sub>), the chloride or *butter of zinc* (ZnCl<sub>2</sub>), the acetate and the cyanide. Sheet-zinc is largely employed for lining water cisterns, baths, &c., for making spouts, pipes, for covering roofs, and several other architectural purposes. Plates of this metal are used as generators of electricity in voltaic batteries, &c.; they are also employed in the production of pictures, &c., in the style of woodcuts. (See ZINCOGRAPHY.) Zinc is much employed in the manufacture of brass and other alloys, and in preparing galvanized iron. See GALVANIZED.

**Zinc** (zingk), *v. t.* To coat or cover with zinc. See GALVANIZED.

Silicon forms a chloride  $SiCl_4$  and an oxide  $SiO_2$ , commonly known as silica. It exists in a few rare minerals, notably in stibicon or hydrotic, which is a silicate of stibicon. It appears to form a link between aluminum and silicon.

Five of the strings are stretched over a fretted keyboard, and are

from their resemblance to flowers, are more or less elongated, and very contractile. They are divided into three sub-orders: — *Zoantharia Malacostraca*, in which the corallum is absent or very rudimentary, *Z. Scleroblastea*, in which it is scleroblastic, and *Z. This, however, is not true of all the newly discovered planets. — 2. A girdle, a belt, a zone. (Rare and poetical.)

A series of pictures representing the different attitudes successively assumed by an object in performing any act from its beginning to its close, as by a horseman in leaping a gate, an acrobat performing a somersault, and the like, is arranged along the interior circumference. The instrument is then set in rapid motion, and the person looking through sees the horseman, etc., as if endowed with life and activity, performing the act proper to his character.

They were called respectively *littoral*, *circum-littoral*, *median*, *infra-median*, and *abysmal*. Subsequent researches, notably those of the Challenger, have demonstrated that the assumed facts were to a great extent erroneous, and are supposed to be confined to the littoral zone having been found at the greatest

**Zoology** (zô-o'lo-jî), *n.* [From Gr. *zôon*, an animal, and *logos*, discourse.] That science which treats of the natural history of animals, or their structure, physiology, classification, habits, and distribution. The term 'natural history' has been frequently used as synonymous with zoology, but such a term is obviously of wider significance, and should be used to indicate the whole group of the natural sciences. Zoology is a branch of biological science, constituting, in fact, with its neighbour branch botany, the science of biology. Its study comprehends such branches as the *morphology* of ani-

mal, or the science of form or structure, which again includes *comparative anatomy*, by which we investigate external and internal appearances, the positions and relations of organs and parts; the *development* of animals, which treats of the various stages leading from the embryonic to the mature state; the *physiology* of animals, which includes the study of the functions of nutrition, reproduction, and of the nervous system; *classification* or *taxonomy*, which assigns to the various individuals their proper place in the scale of life. A new department has been added in recent times, sometimes called *etiology*, which investigates the origin and descent of animals, or treats of the evolutionary aspects of zoological science. Various systems of classification have been framed by zoologists. Linnaeus divided the animal kingdom into six classes, viz. *Mammalia*, *Birds*, *Fishes*, *Amphibia*, *Insects*, and *Worms* (Vermes). Cuvier proposed a more scientific arrangement. He divided the animal kingdom into four sub-kingsdoms, viz. *Vertebrata*, *Mollusca*, *Articulata*, and *Radiata*. Recent classifications are more strictly based on morphological characters. Professor Huxley recognizes the following sub-kingsdoms: *Vertebrata*, *Mollusca*, *Molluscoida*, *Cœlenterata*, *Annulosa*, *Annuloida*, *Infusoria*, and *Protozoa*. See these terms.

**Electric**, *a.* [add.]—*Electric lamp*, the contrivance in which the electric light is produced. See *Electric light* below.—*Electric light*, a brilliant light, the result of heat produced by the force of electricity either evoked by the chemical reaction of a metal and an acid, or generated by a magneto-electric or other machine. The *arc light* is produced when two carbon pencils are attached to the electrodes of a powerful magneto-electric machine or galvanic battery, and their points are brought together long enough to establish the electric current. If they are then separated to a small distance, varying according to the strength of the current, the current will continue to flow, leaping across from carbon to carbon, emitting a light of great intensity at the space between the points. The name *Voltaic* or *electric arc* is given to that portion where the current leaps across from point to point, the term *arc* being suggested by the curved form which the current here takes. The *incandescence light* is obtained by the incandescence, by means of electricity, of various substances, including carbon, in a vacuum. Many forms of apparatus are in use for producing the electric light, distinguished either by the form of the generating machine, the distribution of the current, or the kind of burner. In the Jablochhoff light, the burner consists of a pair of carbon spindles placed parallel to one another, with an insulating earthy substance between them. Its combustion may be roughly compared to that of an ordinary candle, where the

earthy substance takes the place of the wick. Other forms of the 'candle' burners are in use, such as the Lontin, the Jamin, &c. The Maxim, Edison, and Swan lights proceed from an incandescent filament of carbon in a more or less perfect vacuum.—*Electric machine*, [add.] Besides machines in which electricity is generated by friction, electric machines are now common in which an electric current is generated by the revolution near the poles of a magnet or magnets of one or more soft-iron cores surrounded by coils of wire, these machines being known distinctively as *magneto-electric machines*. A *dynamo-electric machine* is a machine of this kind, in which the induced currents are made to circulate round the soft-iron magnet which produced them, thus increasing its magnetization. This again produces a proportionate increase in the induced currents, and thus by a successive alternation of mutual actions very intense magnetization and very powerful currents are speedily obtained. There are many forms of these machines, such as Gramme's, Siemens', Wilde's, Brush's, &c., used extensively in electric lighting, and as a motor for machinery, electric railways, &c.—*Electric pendulum*, a form of electroscope consisting of a pith ball suspended by a non-conducting thread.—*Electric railway*, a railway on which electricity is the motor. Only short lines have as yet been constructed. On one of these the wheels of the carriages are set in motion by a dynamo-electric machine placed between them and below the floor. This machine is actuated by an electric current produced by another dynamo-electric machine, which is stationary and driven at a high rate of speed by a steam-engine. The current is conveyed by underground wires to the rails, and these being insulated, it reaches the carriage through them.

# PRONOUNCING VOCABULARY OF GREEK, LATIN, SCRIPTURAL, AND OTHER ANCIENT NAMES.

## RULES AND DIRECTIONS FOR PRONUNCIATION.

The pronunciation indicated in the following list is that usually heard from educated speakers of English, who as a rule do not attempt to pronounce Greek or Latin or Scriptural names in the way in which they were pronounced by the ancients themselves—if that could be with certainty determined—but rather seek to assimilate the pronunciation to that of their own language. There is therefore no great difficulty in the pronunciation of such words, and by attention to the following rules and directions any name in the list can be sounded correctly.

Special knowledge required for the right pronunciation of these words is—

1. The seat of accent; and
2. The sound to be given to the letters as they stand in the word.

The syllable of the word which is to receive the accent is denoted by the usual mark, an acute accent, placed immediately after it, as the first syllable of the word *Ca'to*, the second of the word *Cam-by'ses*, and the third of the word *San-cho-ni'a-thon*. The seat of the accent varies considerably in words of more than two syllables, though it is never on the last syllable; in dissyllables it is always on the first. The pronunciation of the latter, therefore, as also of monosyllabic words, after the following remarks are studied, will present no difficulty, and consequently many of them (especially those belonging to the classical languages) have been omitted from the list below. The division into separate syllables is denoted by the mark - as well as by the accentuation mark. Two vowels coming together in a word, but having one or other of these marks between them, must therefore always be pronounced as belonging to different syllables.

The sounds to be given to the several letters will be considered under two general heads, viz.: 1. The vowel letters; and 2. The consonant letters. It must always be borne in mind that silent letters, so common in English (*e* final for instance), are the exception in the words here treated of.

### I. THE VOWEL LETTERS.

The vowels heard in the words *fate*, *me*, *pine*, *note*, and *tube*, are called long vowels; while those heard in the words *fat*, *met*, *pin*, *not*, and *us*, are called short vowels.

1. When any of the vowel letters *a*, *e*, *i*, *o*, and *u*, constitute an accented syllable, and also when they end one, they are pronounced as long vowels; thus, in the first syllable of the words *Ca'to*, *Pe'lops*, *Di'do*, *So'lon*, and *Ju'ba*, they are pronounced as in the respective key-words *fate*, *me*, *pine*, *note*, and *tube*.

2. When the vowel letters are followed by one or more consonants in a syllable, they are pronounced as short vowels; thus, in the first syllable of the words *Cas'ca*, *Hec'u-ba*, *Cin'na*, *Cor'du-ba*, and *Pub'li-us*, they are pronounced as in the respective key-words *fat*, *met*, *pin*, *not*, and *us*.

3. When the letter *a* constitutes an unaccented syllable, as in *A-by'dos*, and when it ends one, as in *Ju'ba*, it is pronounced as *a* in *fat*.

4. The so-called diphthongs *æ*, *œ*, are always pronounced as the *e* of *me*, and are therefore simple vowel sounds, as in *Cæ'sar*, *Præ'tum*, *Æ'o-lus*, *Bœ'o-ti-a*.

5. The digraph *ai* in a syllable is pronounced like *ai* in *wait*. It occurs only in Scriptural names. The *ai* of Greek words was pronounced like common English affirmative *ay*, or much the same as *i* in *pine*; but by the common spelling

it is Latinized into *æ*. An *a* and an *i* coming together, but belonging to different syllables, will of course have either the accent or the mark - between them.

6. When *r* follows *a* in the same syllable, and is itself followed by a consonant, as in *Ar'go*, *Car-tha'go*, the *a* is pronounced as in *far*. In such a word as *Ara-dus* it is sounded as in *fat*.

7. The digraph *au*, as in *Clau'di-us*, *Au-fid'i-us*, is pronounced as *a* in *fall*. An *a* and a *u* coming together, however, may belong to different syllables, as in *Em-ma'us*.

8. When *e* constitutes an unaccented syllable, as in the first of the word *E-te'o-cles*, and when it ends one, as in *E-vad'ne*, it is pronounced as *e* of *me*. And when *e* is followed by *s* as the final letter of a word, as in *Her'mes*, *Ar-is-toph'a-neas*, it is always pronounced as *e* of *me*.

9. When *e* is followed by *r* in the same syllable, as in *Her'mes*, *Mer-cu'ri-us*, the *e* is pronounced as *e* of *her*. The letters *i*, *u*, and *y*, before *r*, have the same sound, as in *Vir'gil*, *Bur'sa*, *Cyr'nus*. When *er* is followed by a vowel, however, *e* is sounded as in *met*, thus *Er'a-to*, *Mer'o-e*.

10. The digraph *ei*, as in *Plei'a-des*, is pronounced as *i* of *pine*. An *e* and *i* coming together, however, may belong to different syllables. Compare Rules 5 and 7.

11. The diphthong or digraph *eu*, as in *Leu-cip'pus*, *E-len'sis*, *Ti-mo'theus*, is pronounced as *u* of *tube*. It occurs chiefly in Greek names. In other cases the *e* and *u* belong to separate syllables. Compare Rules 10 and 7.

12. When *i* constitutes the first and last syllables of words, whether accented or not, as in *I-be'ri-a*, *Fa'bi-i*, it is pronounced as *i* of *pine*. And *i* as the terminal vowel of a syllable at the end of words is also so pronounced, as in *Im'ri*, *A-ceph'a-li*.

13. But *i* at the end of any other unaccented syllable than the last, as in *In'di-a*, *Fa'bi-i*, is pronounced as *i* of *pin*.

14. In many cases *i* assumes the value of *y* consonant in English; thus *Aquileia* is pronounced as if *Aqui-le'ya*, *Caius* as if *Ca'yus*. This is especially common in the terminations of words.

15. *O* at the end of an unaccented syllable, as also when constituting an unaccented syllable by itself, is generally pronounced long or of medium length. Followed by *r* in the same syllable, as in *Gor'gus*, it is not usually pronounced long, but as *o* of *not*. The *o* in such a position is, however, by some speakers pronounced rather long than short, this being pretty much a matter of taste.

16. At the end of an unaccented syllable, or forming an unaccented syllable (as in *Æs'u-læ*, *A-bi'hu*), *u* is pronounced much the same as when accented, but shorter. Following *q* it is pronounced as *w*; thus the second syllable of *Equicolus* is pronounced exactly as the English word *quick*.

17. The letter *y* is pronounced as *i* would be in corresponding positions; thus the *y* in *Ty'a-na* is as *i* of *pine*; and the *y* in *Tyn'da-rus* as *i* of *pin*.

### II.—THE CONSONANT LETTERS.

The consonant letters, *b*, *d*, *f*, *h*, *j*, *k*, *l*, *m*, *n*, *p*, *q*, *r*, *s*, *t*, *y*, and *z*, have each but one sound, and as that is the English sound, they present no difficulty. The letters *c*, *g*, *s*, *t*, and *x*, have each more than one sound, and hence require rules to pronounce them aright.

1. *C* and *g* are hard, or sounded as in *call* and *gun* respectively, when immediately followed by the vowel letters *a*, *o*, and *u*, either in the same or in the following syllable, as in *Cas'ca*, *Cor-ne'li-a*, *Cur'ti-us*, *Hec'a-te*, *Hec'u-ba*, *Gal'lus*,

Gor'di-um, Au-gus'tus, Meg'a-ra, Teg'u-la. *C* and *g* are also hard immediately before other consonant letters, as in Clau'di-us, Cras'sus, Ec-bat'a-na, Hec'tor, Glau'cus, Gra'vi-us, Bag'ra-da, Bo-du-ag-na'tus.

2. *C* and *g* are soft when immediately followed by the vowel letters *e*, *i*, and *y*, either in the same or in the following syllable, as in Cer'be-rus, Cin'na, Cy-re'ne, Cic'e-ro, Tic'i-da, Gel'li-us, Gis'co, Gy'as, Vo-log'e-ses, Um-brig'i-us. In words such as Dacia, Sicyon, Phocion, Accius, Glau'cia, Cap-pa-do'ci-a, the *ci* or *cy*, having the accent immediately before it, is often pronounced as *shi*: some authorities, however, retain the *s* sound in such words.

3. In Scriptural names, such as Magiddo, Gideon, *g* is always hard, except in the single word Bethphage. In consulting the list this will have to be kept in mind. The *s* following Scriptural names will serve as a guide.

4. When *c* and *g* are initial letters of a syllable, and immediately followed by *n* or by *t*, they are usually left silent in pronunciation; thus, Cneus is pronounced Ne'us; Gnidus, Ni'dus; and Ctenos, Te'nos. Some scholars, however, pronounce the *c* and *g* in these combinations; and should the reader elect to do so, he must pronounce them hard.

5. In Scripture names *h* often follows a vowel in the same syllable; as in Micah, Isaiah, Calneh, the vowel in these cases being pronounced with its short sound and the *h* being mute. In Greek names *rh* is equivalent to simple *r*.

6. The digraph *ch* is pronounced as *k*, thus, Achilles is pronounced A-kil'les; Chios, Ki'os; Enoch, E'nok. The Scripture name Rachel is the single exception to this rule, *ch* in it being sounded as in *chain*.

7. *S* as an initial of words is pronounced as *s* of the word *son*, as in So'lon, Spar'ta, Styx. It is commonly so pronounced as an initial of other than the first syllable of words, as in Su'sa, Si-sen'na; but in some exceptional cases the *s* receives the sound of *z*, as in the word Cæsar, which is pronounced Cæ'zar. These exceptions will be denoted by the direction '*s* as *z*,' inclosed within parentheses, thus, Cæ'sar (*s* as *z*). See also rule 10.

8. *S* final of words, when preceded by *e*, is pronounced as *z*; thus Aristides is pronounced Ar-is-ti'dez. And the *e* so placed is that of the word *me* as remarked already. But when the final *s* is preceded by any other vowel, it is pronounced as *s* of *son*, as in Archytas, Amphipolis, Abydos, Adrastus.

9. *S* at the end of words, when preceded by a liquid, *l*, *m*, *n*, or *r*, is pronounced as *z*, as in Mars, which is pronounced Marz; Aruns, A'runz.

10. *Si* forming an unaccented syllable, preceded by an accented syllable with a final consonant, and followed by a vowel, is commonly pronounced *shi*; as in Al'si-um, Hor-ten'si-us. When the *si* is preceded by a vowel it is very commonly pronounced as *zi*, as in Mæ'si a, He'si-od, A-le'si-a, Cæ'si-us; and sometimes as the *s* of *pleasure*, as in As-pa'si-a, The-o-do'si-a. But the usage in these cases is not very well settled, and some scholars carefully preserve the pure sound of the *s*, and do not even in such situations allow it to degenerate.

11. When *ti* followed by a vowel occurs next after the accented syllable of a word, it is pronounced as *sh*; thus, Statius is pronounced Sta'shi-us; Helvetii, Hel-ve'shi-i; and similarly with Abantias, Actium, Maxentius, Laertius, &c. The proper sound of the *t* is preserved, however, when *ti* is accented or when it follows *s* or another *t*, as in Mil-ti'a-des, Sal-lus'ti-us, Brut'ti-i; so also in the termination -tion, as in A-e'ti-on. In such words as Domitius the *t* itself may be said to receive the *sh* sound: Do-mish'i-us.

12. The digraph *th* is pronounced as *th* of the word *this*, as in Tha-li'a.

13. *X* at the beginning of syllables is pronounced as *z*, thus, Xenophon is Zen'o-phon. But at the end of syllables it retains its voiceless sound of *k*, thus Oxus is pronounced Oks'us. If, however, the *x* end a syllable which immediately precedes a vowel in the accented syllable, then the *x* receives its voiced sound, that of hard *g* followed by *z*, as in Alexarchus, which is pronounced Al-egz-ar'chus.

14. The letter *p*, when initial, and followed by *n* or by *t*, is not usually uttered, as in Pnigeus and Ptolemæus, which are pronounced Ni'geus and Tol'e-mæ-us, though some persons sound the *p*.

15. *Ph* represents the Greek character φ, and is pronounced as *f*; thus, Philippi is pronounced Fi-lip'pi. But when *ph* is followed by a consonant in the same syllable, as in Phthia, it is usually omitted in utterance, and the word is pronounced Thi'a. Some scholars, however, pronounce it.

16. *Ps* represents the Greek character ψ, which as an initial is pronounced as *s*, the *p* being generally omitted in utterance, as in Psyche, which is pronounced Sy'ke. Many scholars, however, now pronounce the *p* as well as the *s* of *ps*.

17. As a general rule, when any combinations of consonant letters which are difficult to utter occur at the initial part of words, the utterance of the first may be omitted, thus, Tmolus may be pronounced Mo'lus; Mnemosyne, Ne-mos'y-ne; while the digraph *ch* is dropped in Chthonia, making the pronunciation Tho'ni-a.

# PRONOUNCING VOCABULARY

## OF

# MODERN GEOGRAPHICAL NAMES.

### NOTES ON THE SPELLING AND PRONUNCIATION.

FOREIGN geographical names are spelled in English books either in the same manner as they are spelled in the language of the country to which they belong, or phonetically in accordance with the prevailing sounds of the letters of the English alphabet. The first method can, of course, be adopted only for names belonging to countries in which the Roman alphabet is used with or without diacritic marks. In the following notes on the pronunciation of foreign names the sounds indicated as those corresponding to the letters of foreign alphabets are explained, where necessary, by the key-line at the foot of the page.

In that key-line it will be seen that six signs are used to represent un-English sounds. These must be learned by the ear from those who are able to render them accurately, but it may be mentioned that the French sound heard long in *vêl* and short in *bûl* is like the sound of *u* in the Scotch word *abune*; that that heard long in *blêu* and short in *neûf* has some resemblance to the sound of *e* in *her*; that the sound represented by *â* (as in the French *on*) is produced by emitting voice through the mouth and nose at the same time, and is accordingly not a pure nasal (like the English *ng* in *sing*) but a semi-nasal; and that the *ch* in the German *nacht* is a strongly aspirated guttural like *ch* in the Scotch word *loch*. Strictly speaking two sounds are represented in German by *ch*, or by *g*, which is sometimes its equivalent. After the vowels *a*, *o*, *u* it is a guttural as in the Scotch *loch*, but after the other vowels and after consonants it is produced by the emission of breath between the point of the tongue and the fore-part of the palate.

Even with these signs for un-English sounds it must be remembered that the sound indicated for the letters of foreign alphabets is very often only an approximation to the true pronunciation, as foreign languages have a great many shades of sound which can be acquired only by those who have familiarized themselves with these languages as they are actually spoken by the people, and which, besides, no Englishman would ever think of trying to reproduce in pronouncing foreign names while reading or speaking English. It will be observed that, as the key shows, *y* is always used with its consonantal or semi-vowel sound as in *yes*. Thus when it is stated that the Hungarian *gy* has the sound of *dy*, it is to be understood that at the end of a word that combination does not form a separate syllable, but goes to form one syllable with the preceding letters. The Hungarian prefix *Nagy*, for example, is pronounced in one syllable *Nody*, the *d* being followed by the consonant *y* with an effect closely resembling that of a very soft *zh*.

A. Some rules for the pronunciation of languages using the Roman alphabet.

#### VOWELS AND VOWEL DIGRAPHS.

*a* is usually sounded *â*, but sometimes long sometimes short. In Hungarian it is sometimes like *o* in *not*.  
*â* in Swedish is sounded *ô*.  
*â* or *æ* is usually sounded like *â* or *e*, in Flemish (and old Dutch) like *â*.  
*ä* in Polish is sounded like the French *on*.  
*aa* in Danish is sounded as *ô*, in Dutch as *â*.  
*ai* and *ay* usually have each of the vowels sounded, the sound of *â* being rapidly followed by that of *ê*. In

German they are sounded like *i* in *pine*, in French mostly like *â*.

*ao* in Portuguese is sounded as *oui*.

*au* is usually pronounced either with the sounds of the vowels separately, or as a diphthong like *ou*. In French it is pronounced like *o* in *note*.

*e* is usually sounded like *â* or *e* in *met*. In Spanish it always has the latter sound. Very often it has an obscure sound as in the English *golden*. In French it is often mute.

*ë* in Polish is sounded like the French *ain* (*añ*).

*é* in Bohemian and Servian is sounded as *ye* or *yâ*.

*eau* in French has the sound of *o* in *note*.

*ei* and *ey*, like *ai* and *ay*, usually have each of the vowels sounded separately, the sound of *â* being rapidly followed by that of *ê*. In Dutch and German they have the sound of *i*. In French they are pronounced like *â* or *e*.

*eu* is sounded in Dutch as in French, in German like *oi*, in other languages with the sounds of the vowels separately.

*i* is usually sounded like *ê*, or, when short, often like *i*. In Dutch, German, and French is sounded like *ê* except where the letters belong to two syllables.

*ij* in Dutch has a sound like that of *i* in *pine*, but more open, that is, with less of the *ê*-sound at the close.

*o* is usually sounded like *ô* or *o*, in Danish and Norwegian sometimes like *ô*.

*ö* or *oe* is sounded in German, Danish, and Swedish like *eu* in French.

*ø* in Danish has a sound similar to *ö*, but somewhat closer.

*ó* in Polish is sounded like *o* in *move*.

*oi* is usually pronounced with the sounds of the separate vowels, in French it is like *wa* in *war*.

*ou* in French has the sound of *ô*, in Dutch and Norwegian that of *ou*.

*u* is usually sounded as *ö* or *u*; in French, as already mentioned, the sound is peculiar. In Danish, when short, it is sounded like *ê*; in Dutch, when short and followed by a consonant in the same syllable, like *u*; when long, like *û*; in Welsh, without an accent mark, like *i*.

*ü* or *ue* in German is sounded like *û* or *ü*.

*û* in Welsh is sounded like *ê*.

*ui* in Dutch is pronounced like *oi* in *oil*.

*y* is usually sounded like *ê*; in Danish, Swedish, and Polish like the French *æ*. In old Dutch it is used where the digraph *ij* is used in modern orthography. In Welsh, without an accent mark, it has the sound of *u*, except at the end of a word when it sounds like *i*.

*ÿ* in Welsh has the sound of *e* in *me* (like the Welsh *û*).

#### CONSONANTS AND CONSONANTAL DIGRAPHS.

Most of the consonants have the same sound in the languages of the European continent using the Roman alphabet as they have in English, but the following peculiarities are to be noted:—

*b* at the end of a word is often sounded in German like *p*. In Spanish it is pronounced with very feeble contact of the lips so as to be softened almost to a *v*-sound.

*c* before another consonant and before the vowels *a*, *o*, *u* is usually sounded like *k*; in French, Danish, Swedish, and Portuguese it is sounded in other situations like *s*, in Italian like *ch* in *chain*, in Spanish like *th* in *thén*,

Fâte, fâr, fat, fâll; j, job;	mê, met, hér, golden; FH, theu; th, thin;	pine, pin; zh, azure.	nôte, not, môte; French, vûe, bûl;	tub, bull; blêh, neûf;	oil, pound; h, on.	ch, chain; German, ch, nacht.	g, go;
----------------------------------	--	--------------------------	---------------------------------------	---------------------------	-----------------------	----------------------------------	--------

in German like *ts*. In Italian where another vowel follows *ci* (as well as *gi* or *sci*) the *i* is not sounded. In Spanish America *c* is usually pronounced as *s* in those cases in which in Spain it is pronounced *th*. In Bohemian and Polish it is always sounded like *ts*, and in Welsh always like *k*.

*ç* is used in French and Portuguese to indicate the *s*-sound of *c* before the vowels *a*, *o*, and *u*.

*ch* in Dutch, Polish, and Bohemian, as well as in German, has the sound of *ch*; in Italian it has the sound of *k*; in French (except in some words derived from the Greek, in which it is sounded like *k*) that of *sh*.

*cs* in Hungarian has the sound of *ch* in *chain*.

*cz* in Polish has the sound of *ch* in *chain*, in Hungarian that of *ts*.

*d* at the end of a word in German and Dutch is often sounded like *t*. In Spanish and Danish between two vowels, and after a vowel at the end of a word, it is softened to the sound of *ʃh*, and in the latter language the same sound is given to it even when doubled. Strictly speaking the Spanish *d* is a dental *d*, being sounded by placing the tip of the tongue close to the lower edge of the upper front teeth. At the beginning of a sentence and when the *d* is preceded by another consonant, whether in the same word or another, the tongue is more firmly pressed against the teeth and a sound like that of the English *d* is produced, but in other cases the contact is so slight as to produce a sound almost exactly like that of *ʃh*. At the end of words even this sound is almost inaudible. When *d* comes after *l*, *n*, *r* in Danish it is not sounded at all, and it is still more frequently silent in the Norwegian pronunciation of the language.

*dd* in Welsh has the sound of *ʃh*.

*dź* in Polish is sounded like *day*.

*g* before a consonant and before the vowels *a*, *o*, and *u* mostly has the sound of *g* in *go*; and it has the same sound before other vowels also in German and Danish, and in all situations in Polish and Welsh. After a vowel it frequently has in German and Danish a guttural sound, and in the Norwegian pronunciation of the latter language it is often silent in that situation. In Dutch it is always a deep guttural, except in the combinations *gh* and *ng*, the former of which is pronounced like *g* in *go*, the latter like *ng* in *sing*. In French, Portuguese, Spanish, and Swedish it has the sound of the *j* of the same languages in all situations in which it has not the sound of *g* in *go*, and in Italian it is then sounded like our *j*. (See above under *c*.)

*gh* in Italian and Dutch has the sound of *g* in *go*.

*gl* in Italian has the sound of *ly*.

*gn* in French and Italian has the sound of *ny*.

*gu* in French always, and in Portuguese and Spanish before *e* and *i*, has the sound of *g* in *go*.

*gy* in Hungarian has the sound of *dy* or *dzh*.

*h* in French, Italian, Spanish, and Portuguese is silent or scarcely audible. In Spanish it is heard as a slight aspiration before the combination *ue*. In Danish it is not sounded before *j* and *v*.

*j* in most languages has the sound of *y*, in French and Portuguese that of *zh*, in Spanish that of *ch*. In Danish the sound of the Danish *j* (that is, the sound of the consonant *y*) is always interpolated after the consonants *k* and *g* before the vowels *æ*, *ö*, *ä*, *y*, and *i*. In Hungarian at the end of a syllable *j* has the sound of *e* in *me*.

*k* in Norwegian before *e*, *i*, *j*, *y*, and the modifications of *a* and *o*, is sounded like *ty*.

*ʔ* represents in Polish a sound peculiar to that language and Russian. It is produced by attempting to sound an *l* with the point of the tongue directed further back in the palate than for the ordinary *l*, and with very slight contact between the tongue and palate.

*lh* in Portuguese has the sound of *ly* (Ital. *gl*).

*ll* in French in formal speech has the sound of *ly*, but colloquially is generally sounded like the consonant *y* without any *l*-sound. In Spain it always has the former sound, but in Mexico the latter is often substituted. In Welsh it has a peculiar sound, which is approximately rendered when one attempts to pronounce *tl* at the beginning of a syllable.

*m* in French and Portuguese often has the sound of *n*. See preliminary remarks.

*ñ* in Spanish

*ń* in Polish

*ň* in Bohemian

*nh* in Portuguese

*qu* in French always, and in Portuguese and Spanish before *e* and *i*, is sounded like *k*.

*r* is almost always more strongly trilled than in English.

*ř* in Bohemian

*rz* in Polish

*s* in German is usually pronounced soft, like English

*z*, at the beginning of a word where a vowel follows; in Hungarian it is sounded as *sh*.

*ś* in Polish has the sound of *sy*.

*sc* in Italian before *e* and *i* has the sound of *sh*. (See above under *c*.)

*sch* in German has the sound of *sh*, but in Dutch and Italian has that of *s* followed by the respective sounds of *ch*, in Dutch accordingly it is equivalent to *sch*, in Italian to *sk*.

*sk* before *e*, *i*, *j*, *y*, and the modifications of *a* and *o* is sounded in Norwegian like *sh*.

*stj* in Swedish when followed by a vowel has the sound of *sh*.

*sz* in Polish

*š* in Bohemian

*sz* in Hungarian

*t* in Spanish is dental like the Spanish *d*.

*th* in Welsh is sounded like *th* in *thin*, in all other European languages using the Roman alphabet like the simple *t*.

*tj* in Swedish when followed by a vowel has the sound of *ch* in *chain*.

*ts* in Hungarian is sounded like *ch* in *chain*.

*w* in German and Dutch has a sound closely resembling that of *v* produced by bringing the lips feebly into contact, not by placing the upper teeth against the lower lip. In Welsh it has the sound of *y* or *ö*.

*x* in Portuguese has the sound of *sh*; in old Spanish spelling it is used where *j* is now used to represent the sound of *ch*.

*y* is usually a vowel, but in Spanish it has also a consonantal sound like the English *y*, and the same sound is heard in Hungarian after *d*, *g*, *l*, *n*, and *t*.

*z* in German and Swedish has the sound of *ts*, in Italian sometimes that of *dz* sometimes that of *ts*, in Spanish that of *th* in *thin*. In Spanish America this *th*-sound usually gives place, like the *th*-sound of *c*, to that of *s* in *sing*.

*ź* in Polish has the sound of *zy*.

*ż* in Polish

*ž* in Bohemian and Servian

*zs* in Hungarian

**B. Hints on the pronunciation of geographical names belonging to languages not using the Roman alphabet.**

The general rule regarding the spelling of such names is to spell them in English phonetically in accordance with the prevailing sounds of the letters of the English alphabet. In such phonetic spellings, however, the vowels usually receive their continental sounds (as in *far*, *vein*, *pique*, *rule*). In Indian and some other Asiatic names and in Arabic names *a* is often used also to represent the sound of the English *u* in *but*. The vowel digraph *ai* usually represents the sound of *y* in *fly*, but sometimes (as in all Greek names) that of *a* in *fate*; *ei* most commonly that of *a* in *fate*, but sometimes that of *y* in *fly*; *au* for the most part sounds as *ow* in *now*, but in some cases as *a* in *fall*. In the spelling of Indian names this last digraph is often used where *á* is now mostly used, the sound intended being that of *a* in *far*, or perhaps one somewhat broader. The consonants *j*, *w*, *y*, *z* have as a rule their characteristic English sounds, as in *jet*, *yet*, *well*, *zeal*; *g* usually has its hard sound as in *get*. *Ch* usually represents the sound which it has in *chain*; *gh* sometimes that of a very rough aspirate, sometimes a sound like that of the Northumberland or Berwickshire burr, sometimes, before *e* or *i*, merely the

hard sound of *g*; *kh* is the combination most frequently used to represent the sound of *th*; and *th* usually stands for the sound which it has in *this*, sometimes for that which it has in *then*.

In the spelling of geographical names belonging to languages which do not use the Roman alphabet (as also of those which were first put in writing by Europeans) numerous variations are found from different causes, and it will throw some light on the pronunciation to note what the principal causes of these variations are.

1. Very often the variation is due to the irregularity in the use of our own alphabet, which leads one person to represent the same sound phonetically in one way, another in another. From this cause *s* and *z* are frequently interchanged, as in *Kasan*, *Kazan*; so also are *oo*, *ou*, and *u*, where the sound of *u* in *bull* or in *rule* is intended, as in *Moorzook*, *Mourzouk*, *Murzuk*, &c.; and so also are *i* and *y*, as in *Ustyanak*, *Ustiansk*; *Krasnoyarsk*, *Krasnoiarak*. Hence likewise those names which are spelled with *a* to represent the sound of *u* in *but*, are also frequently found spelled with *u*, as in *Panjab*, *Punjab*.

2. Sometimes the variation is due to the obscurity of the sounds themselves, as where a vowel sound is so short that its exact quality can hardly be determined, as in *Bedouin*, *Bedawin*; or where a short vowel sound seems to one ear to make a separate syllable, while to another ear no such syllable seems to be heard, as in *Bassora*, *Basra*; *Wargela*, *Wargla*.

3. In other cases the variation is due to the adoption in English of a continental mode of spelling, as where *dj* is adopted from the French for *j*, as in *Djebel* for *Jebel*, or *tch* from the same language for *ch*, as in *Nertchinak* for *Nerchinsk*, *Kamtchatka* (the common spelling) for *Kamchatka*, or *j* from the practice of most continental nations for *y*, as in *Jakutak* for *Yakutsk*.

When the variation in spelling is due to any of these causes, a comparison of the different forms of the name will often serve as a good indication of the correct pronunciation, where any one of them might leave it doubtful; for the correct pronunciation must be more or less consistent with all the different forms. Thus when *Bassora* is also found spelled *Basra* it is clear that the correct pronunciation cannot be *Basso'ra*, and when *Bedouin* is found spelled also *Bedawin*, *Bedaween*, &c., it shows that the accents lie on the first and third syllables, and that the *i* in *Bedouin* is pronounced as *e* in *me*.

4. Other variations are due to the fact that the sounds to be represented have no signs for them in the Roman alphabet or any of its commonly used digraphs, so that different signs are adopted to represent them approximately in accordance with the conceptions of different persons. One of the chief instances of this sort is a sound existing in Arabic and Hindu resembling the Northumbrian burr. Usually this sound is represented by *gh*, but in the case of many Arabic names in North Africa it is often represented by *rh* or *r*. Thus *Ghadames* is often spelled *Rhadames*, the tribe of the *Songhay* often *Sonrhay*.

5. In other cases the variation is accounted for by differences of dialect, or different pronunciations of the same dialect in different parts of the country or region in which a particular language is spoken. In this way arise many of the varieties of spelling in Chinese, Indian, and Arabic names. In the last one of the most notable dialectical peculiarities of pronunciation is in the case of the Arab character usually sounded as *j*, but in some parts, as in Egypt, as *g* in *get*. For this reason the Arabic *Jebel* (mountain) is usually spelled in Egyptian names *Gebel*, in which *g* is intended to have its hard and not its soft sound.

6. Another cause of variation is the fact that the strict rule of phonetic spelling is sometimes departed from, and the English form of a name is partly accommodated to the spelling of the language to which it belongs, the same letter in that language being always represented by the same in English, even though the pronunciation may vary in the original language. This is frequent in Russian names, in which the sounds of *v* and *f*, those of *a* and *o*, &c., are often represented by the same letter,

and in which the Russian character representing the sound of *a* in *fat* or *e* in *met* sometimes stands for the same sound preceded by that of the consonant *y*. In this way are explained such variations as *Kief*, *Kiev*; *Semipolatinak*, *Semipalatinak*; *Semiryechensk*, *Semirechenak*.

7. Lastly, the foreign spelling of a name is sometimes adopted for native names in regions out of Europe belonging politically to European powers. Thus *Sourabaya* may sometimes be seen spelled in the Dutch fashion, *Soerabaja*. In Spanish and Portuguese America this is done almost uniformly.

In Chinese the digraph *ao* represents the sound of *a* in *far* gliding into that of *o*, the whole sound closely resembling that of *ow* in *now*; *ei* represents the sound of *a* in *fat* gliding into a very short *i*-sound (as in *me*); in *ia*, *ie*, *iu* the sounds of *a*, *e*, *u* are preceded by a very short *i*-sound, a sound almost identical with that of the consonant *y*; *oo* (for which *u* is often used) usually represents the sound of *u* in *bull* or in *rule*, but sometimes it represents a long *o* gliding into a very short sound like that of *u* in *bull*. When *o* precedes *a* or *ei* it is sounded very short so as to be almost equivalent to the consonant *w*; hence we have such spellings as *Whangho* (or *Hwangho*) and *Kweichoo* or *Queichoo*, as well as *Hoangho* and *Koeichoo*. The initial *ng* is a nasal, as in the word *sing* (not as in *finger*), and this initial sound is also met with in names belonging to the other monosyllabic languages of Eastern Asia, as well as in some African and New Zealand names.

In Indian, Arabic, and some other names aspirated consonants occur, and are represented in spelling by an *h* following the consonant, as in *Bhágálpur*. The proper sound of this combination is accurately represented by the letters composing it, but in the English pronunciation of such names this peculiarity is commonly disregarded.

In African words the consonant *m* used as a prefix has a shortened sound of *um*, and in the South African colonies this prefix is so spelled, as in *Umtata*, *Umtzila*, &c. By travellers in equatorial Africa, however, the simple *m* is always used, as in *Mpwapa*. Except at the end of a word *y* is always the consonant. Lake *Nyasaa*, for example, is to be pronounced as two syllables, *Nyas'sa*, not in three as *Ni-as'sa*.

For the spelling of Maori names in New Zealand the Roman alphabet was introduced by the English missionaries, but only fourteen characters are required, namely, *a*, *e*, *i*, *h*, *k*, *m*, *n*, *o*, *p*, *r*, *t*, *u*, *w*, and the nasal *ng*. The vowels have the continental sounds, and are always sounded separately, never coalescing into a proper diphthong.

In the following list showing the pronunciation of geographical names the only diacritic marks which are used are the acute, grave, and circumflex accents (´, `), the modification mark (˘), the cedilla (¸), and the tilde (~); and it will be understood that, where the respelling of a name indicates the pronunciation of a diacritically marked letter not so marked in the name as given in the list, that name is spelled with a letter so marked in the language of the country to which it belongs. Thus, when it is stated that the Swedish name *Tornea* is pronounced *tor'nä-ö*, it may be inferred, in accordance with the rules just given, that in Swedish that name is spelled *Torneå*. In respelling names to indicate pronunciation the consonants, *b*, *d*, *f*, *h*, *j*, *k*, *l*, *m*, *n*, *p*, *r*, *t*, *r*, *v*, and *z*, and the digraphs *ng*, *nk*, and *sh* always have their usual English sounds, and *s* always has the hissing sound as in *sea*. The key-line gives the explanation of the other signs.

Note.—In consulting this List it should be kept in mind that attention to the preceding notes indicating the variations that may be looked for in the spelling of foreign names will often be of assistance to those doing so in finding the name they are in search of, since names not found under one spelling may be found under some other equivalent spelling. Thus many names not found spelled with *c*, *ch*, *z*, *y*, &c., may be found under the spellings *k*, *kh*, *s*, *j*, &c. respectively; Spanish names in *x* may be found spelled with *j*, Dutch names in *y* may be found in *ij*, German, Danish, and other names in *ae* or *oe* may be found in *ä* (sometimes *e*) or *ö*; and so forth.
